3532. English version of N.AES

Newsgroup: comp.sys.atari.st
Date: 1997-12-05 00:00:00 UTC
From: akanthos@matrix.kapatel.gr
Message-ID: <668ikl$2tj@lithos.kapatel.gr>
Source record: 112520

Is N.AES going to appear in an English version?
I also would like to know if there's any web site about N.AES.

E-mail me at:
Akanthos@matrix.kapatel.gr

Source record: 112521

Hi

I agree with you that surfing the web with an Atari isn't as comfortable as with a PC/Mac running the standard internet software. I totally agree with you. On the one hand this is due to the lack of processor speed and on the other hand due to an operating system not capable of doing several things needed for comfortable web browsing (for example threads for background processing of connections or image dithering, page formatting... [actually MiNT and MagiC could do this, but no one uses it up to now]). But it's NOT!! fair to make down the people who spend their spare time in programming interet software which in most cases don't cost anything. Most of the programs are one man (or woman?) projects and it's quite surprising what these guys put up. Netscape and others are multi-million companies with many hundreds of programmers engaged in programming internet software. If Netscape Navigator was programmed by a single person, the STOP button may would work at this time...

The only thing I want you to is to respect the engaged work some programmers do for the Atari to keep it living a little bit longer although the official Atari is dead.

Greetings

Daniel

Are you using the latest CAB.OVL? If not, then a way to get round this is
to specify a http proxy within CAB. It should work...

As for Apache, it is a web server.

>predictably...NO PPP (Don't even start with MintNET, It's not compatible

There are -3- PPP solutions on Atari computers, and all work. Sounds like
you need to invest a little more time/effort.

1) STing v1.08 with the latest modules.
2) PPP Connect (I-Connect)
3) and yes, Mintnet.

>enough with TOS to even be an atari os) I would NOT pay money for a web

>Atari's...why spend $1000's to get a "FAST" TOS machine then run CAB on it
>what a waste.

The Falcon is excellant for audio use, not just "ok". Most users are not
buying higher end Atari's just to run CAB. CAB is just one of multiple
reasons to have an upgraded/new generation Atari!

> PROVE ME WRONG, please Email me a web browsing system that would actually
>work on a stock Falcon, my falcon is even 14Meg, and You can't be serious

CAB/STing work fine on stock Falcons-many users are doing this even as
we speak. What specifically seems to be your problem?

> Falcon is even a high end Atari and it can't do 16 bit color in
>800 x 600 which is minimal for a PC and atleast possible on a 1993 Mac.

Well, I'm certainly viewing at this level on my 1993 Falcon! :)

> Now how about IRC, forget it! there is no serious chat client for
>the falcon that is an improvement on Unix Shell chat.

I give you Frac and AtarIRC. Both are solid IRC clients. Reliable and very
easy to use. I love playing sounds on other users computers while in "chat"
and having them do the same with me! :)

Any other questions/observations? :)

Hmm, I upload using AFTP and STING quite frequently, and I've never had a
problem of it failing to send the EOF. This combination seems to work
quite fluidly.

That seems to describe every sound player I've tried on my Falcon,
with or without MagiC, especially programs called up each time as
installed applications. Makes me think something in the sound
hardware itself is unstable.

You won't see that, because it's in computerese. I was having
problems with PPP until I added PAP ID/Password (which were the same
as my logon name/password), because my provider intitially told me
not to use it. Now I don't even have to mess with the DIAL.SCR,
because PAP does all that for me.

So try using your logon name and password in the PAP fields and see
if that works. It did for me!

>I am using OKAMI U1.29 for some weeks also, and I am really satisfied finding
>all known to me bugs fixed! Up to date I found only one new bug: in the
>addressbook.

I would appreciate it if you tell me what the bug is.

In general: I would appreciate a message form anybody who downloads
Okami from my Website and uses it.

As for the other matters discussed in this thread: The fact that there
are two versions of Okami now is lamentable, but it seemed more
lamentable to me to let all the new features and bug fixes I had built
into my own version go unused by the rest of the Atari community. For
three years nothing happened to Okami, while I kept on expanding and
fixing the program. Finally, last summer, I made my version available,
first to a friend, who is a NOS user, later publicly via my Web page.
In order not to violate any agreement that might exist, I asked
permission of the original author, Wolfram Roesler, first. I decided
againts advertising the program, because I wanted to avoid confusion
with the "official" version. Then, after six months or so, word got
round and more people started to download the program.

If you are confused with this situation and unsatisfied with it,
please revert to the "official" version. I have added what I consider
to be very useful features to Okami, I have fixed numerous bugs, I use
the program myself every day about fifty times without problems, and
if you want to make use of those new features and bug fixes as well,
you're welcome to it.

Lastly: I have always helped anyone who came to me with questions and
problems and I will continue to do so. So far I have received
virtually no complaints.

On 6 Dec 1997, Joe Kearney wrote:

>Actually I took his letter to be an honest assesment of the state of
>the Falcon internet software at the moment.

But the letter was posted by someone obviously having problems with his Atari-based Internet connections (not just hardware limitations). To say that CAB, STiK and STinG are all trash, which is what he said, is unfair. These are the words of someone frustrated, and because of this the stock hardware -- especially video -- gets dragged down along with everything else.

On 6 Dec 1997, Joe Kearney wrote:

>Actually I took his letter to be an honest assesment of the state of
>the Falcon internet software at the moment.

But the letter was posted by someone obviously having problems with his Atari-based Internet connections (not just hardware limitations). To say that CAB, STiK and STinG are all trash, which is what he said, is unfair. These are the words of someone frustrated, and because of this the stock hardware -- especially video -- gets dragged down along with everything else.

First off, I hate you, Mattias! :^) (CAN $27 for a TT, mumble, mumble, mumble...)

And Brian, you fool! I'm glad to hear that your machine felt as fast as the 233 MHz K6 under Linux, though.

I have a 48 MHz CaTTamaran-equipped TT with 10 meg ST RAM, 16 meg TT RAM (_must_ have for Linux), and a 1 meg Nova card. It _smokes_ (about 300% normal TT with Fast RAM, and that's with no NVDI)! I use a Quantum LPS340 for Atari software, a Floptical, a 128 meg Sony MO, an NEC 3X CD-Rom drive, NEC 4D monitor and I'm working on ScanX to get my Microtek E3 scanner going. All hard drives are external, because the TT power supply can't handle the CaTT, Nova, and maximum memory along with a hard drive. I want an Ethernet card, but I bet I'll have to hack a higher capacity power supply to use it.

I tried to use my Quantum LPS105 for my Linux partition and there's no way to get X and Linux installed. I hate to use anything but Quantums on my Ataris, but I plugged an old IBM 540 meg drive I had in for Linux, so now I have plenty of room. I believe the System Solutions install took about 120 megs for the basic install without upgrades.

IIRC, the PTC will work as a VGA monitor (there may even be a VGA/TT switch on the back). A standard VGA monitor gives you a big blank area to the right of the desktop, but works fine. The scanner you are missing is the Canon IX-12F 300 dpi monochrome/halftone scanner. I have one with the interface card if you're interested (it works particularly well with the SLM laser printer as a copy machine (_much_ faster than the E3/HP LJet4P combo I have now!)). E-mail this guy if you're interested in completing your set, he had a Canon for the PC for sale a while ago: aguba@aol.com.

Best Electronics might have an unpopulated TT Ram card, make sure you get the one that does both 4 and 16 megs. The nibble mode RAM is hard to get, though, so line up the RAM before the board. Brad at Best should be able to tell you the RAM specs. There are also a couple of third-party expansion cards that take standard 32 pin SIMMs, but I'm afraid I have no experience with them.

Good luck, oh! you already have good luck, humpf!

Dan

>CAB. One uses JPEGD.PRG and the other doesn't use the DSP at all.
>Both are, I believe, available from Flinny's page:

Upon further review, I don't believe I was. I just got the CAB 2.5
package and it says the DSP module is named JPEG.OVL and the non-DSP
module is named CAB_JPEG.OVL. I was (and am) using the latter. I
didn't know there was a difference; I just thought one was newer than
the other.

After also reading that the DSP module doesn't handle progressive
JPEGs (which I should have known, if I'd have thought about it), I
think I'll stick with the non-DSP module. Especially since the
module that comes with 2.5 seems a LOT faster. Still not DSP-fast,
but no longer agonizingly slow, either.

Hopefully, someone will write a DSP module that handles progressive
JPEGs.

Actually, he can go as fast as 19.2k, though that wouldn't help him
much, over 14.4k, with uncompressed data, since there'd be no room
left for compression. It would help him with compressed data, though.

Body handling: HTML body converted to readable text

FIRST THE SOFTWARE:

2. TRUEPAINT V 1.02 $19 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color.

5. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon).

6. MIDI QUEST 4.0 $25 (Synthesizer sound editor) I have file list, will send upon request. Works on Falcon also.

7. STALKER 3.04 $19 Get connected with this reliable terminal program up to VT 220. A wide range of setups. All Ataris. Interface with Steno (see Steno) excellent XYZ modem transfer module. Works as
a prog. and Acc!!

8. STENO 2.10 $19 Interfaces with Stalker: You can cut, copy and paste from one to the other. Also works like Prg or Acc; you can even run it as many times as you want and you will have the "copy and paste" option between them.

12. CRAWLY CRYPT collection V. 1 more public domain and shareware (evenFalcon). $10 . This CD rom can be read by a PC also, format compatible.

13. LDW power: excellent spreadsheet. $ 2.00 no manual original disk only. (all Ataris).

HARDWARE

15. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari $40. (has original PC software)

16. SCSI II to SCSI II 50 pin cable. Use it to attach your Falcon/TT to and external SCSI device: (The Jazz, a CD rom, etc.) 2 feet. $17.

Free stuff:
Modem 1200 internal PC
External floppy drive 1DD/no Power supply/cable. good case/mechanism.
Ultimate virus killer UKV 5.9

If interested send ZIP code to ask UPS for charges. I am willing to go down in the prices if you buy more than 2 items. For software with light weighted documentation, I can send it for $3.00 US priority mail.
(if you are in the US; I am willing to send abroad also) Regards, Phil.

Notice: This week, there was a major failure in my server and I lost several business files. Hence, if you see one of this items was in your mail request please do so again, I will give it preference.

Find Gemar. Diamond Back sucks. Gemar is fast and reliable with any SCSI streamer I've tried it with which includes DAT and several QIC 80 drives. Can't say the same for Diamond Back.

Hi all;

I'm using Sting with my slip connection (yes ppp works!)

For some reason, when I send mail, it takes over 30 seconds to connect
to the mail server and start sending the mail. Server addresses are
correct.

Get mail, news and ftp work with no problems.

Any ideas what might cause this? How to fix?

: >from my PC here at work via floppy. Running cbhd.tos locates the drive: it's
: >identified as a seagate 157N, I believe. That's about 48 megs or so? Anyway,

Yes, about 48MB.

: >drive errors. So, question 1) is this driver too new? I've ftp'ed the AHDI
: >5.04 drivers, would those be better? I assume the Atari ACSI->SCSI module
: >will work with most smaller sized SCSI drives if this one is hosed? What is
: >the best HD driver to use, in general, that's either cheap or free?

The driver isn't too new. AHDI 5 is old and generally considered to be
buggy and not worth the trouble. CBHD should be better, otherwise buy
HDDriver.

You should just repartition the disc and start from scratch. Remember to
check the disc for physical damage.

I've been able to make partitions up to 2GB, IIRC, although that was on a
Falcon. I'm not sure if there's some other limit on the TT.

You can put any size SCSI hard disc into a TT. I have an 850MB disc in
mine but you could put a larger one in if you wanted to.

: Anyway, here are the questions I'm left with: what are my options for
: networking to my PC via Linux? Obviously I _CAN_ install Linux in 50 megs,
: but the question is, how useful is it? Or am I just being wishful and Linux
: for the TT has never been around? Can a "dual-boot" be set up so I can boot
: Linux off one partition, and still keep a small Atari partition?

Yes you can use Linux/68k on the TT (there's even some simple GEM based
installation software for it) and I believe you can still use TOS. I
don't use Linux myself, though, so I can't comment further.

There are some networking devices for the TT but they're usually
expensive. The cheapest and slowest solution is to use a serial port at
115k2 (or 157k6 if your PC supports it, although I heard that you can even
use 230k4 but I haven't tried this).

: Right now I'm running the PCI1426 in TT medium resolution (640x480x16). Is
: this within spec? Seems to run just fine, and looks very nice.

Yes. Without a graphics card you can't get higher resolutions than that in
colour.

: Memory expansion: I'm already at 10 megs ST RAM, so I'm interested in
: TT-RAM. How can I increase TT-RAM? Which one does Linux use? I know some
: programs need ST RAM, and some will run in either. Is there a rule of thumb
: I can use?

No, the software should normally work in either ST RAM or TT RAM. Normally
you don't have to worry about which RAM the software uses. The only
exception for me is the Atari laser printer. In this case the page must be
drawn into ST RAM before printing.

You can add more TT RAM by obtaining a TT RAM board. The best way is to
get one that takes SIMMs. I've got an AixTT board in mine with 36MB of 72
pin SIMMs and it works very nicely. There's also a board called the MegTT,
and Best Electronics have it listed somewhat cheaper than the AixTT board,
IIRC. There are also others, including the original Atari TT RAM
boards, some of which are fixed sizes, others take 30 pin SIMMs.

> 48mHz CaTTamaran accellerator

How much for one of these?

I have a daughterboard, which seems to have 8 megs of ST-ram on it.. Does
that exclude the possibility of TT-RAM, or is that a different slot?

>With only 52 meg you will not have much room on your drive for anything
>other than Linux and swap space. TT-Ram can really speed things up,
>Linux is one thing it can really speed up.

Yeah, I'm looking into a larger drive.

>Running under TOS (3 or 4) I never used more than 3 meg of memory, but

Any cheap VME ethernet cards?

>I currently own a 233mHz AMD-k6/W95, and do not see any real difference
>in perfomance over the TT, but the connection into work is easier since
>I can run X without invoking Linux.

That's hard to believe, but then again, W95 is a brutal program.. Linux on
my P208 rocks.

Ok, this is one of the wierded ideas I've had in a while, but it has some strange potential. I was lamenting having sold my STe at the same time I was looking at my Sun 3/50 and a odd thought formed. Why not put a modified TOS kernel on the Sun? The Sun 3/50 used a MC68020@ 14 Mhz ~ the Atari ST using a MC68000@ 8 Mhz. Same instuction set at the processor level. Similar cycle stealing video draw modes on the ST and in the mono modes on the Sun3 series (granted the mono ST was 640x400 and the Sun is at 1152x900, just a modification in the TOS parameters or support to TT mono). The Sun has a SCSI port, and the code for the kernel could redirect the ASCI data to the SCSI port. Drop the parallel port support (the Sun lacks one) and add a second serial. I don't even want to think about ethernet support yet, but it has potential. As a last bonus, Sun3/50 series system are too slow and limited for Sun fans, and therefore cheaply available for other uses.

Ok, there. I fell better now. If I'm crazy and impossible, someone let me know. If not, then it has some possibilities, eh.

They're right! Not a single demo... or anything else for Atari! Not much more than a few links to some net-porn sites. It's not worth the time typing the long URL, unless you're into that sort of smut.

P> difficult because they did not succeed when coming across one of it's recently
P> fixed bugs. They then blamed it on the complexity of the program instead of
P> recognizing it's a bug.

Peter, you might be right and I didn't wanted to put down your efforts in developing your STinG-package. You've done a great job for sure. Viewing lots of those mesages here that tell us of the many successes with STinG I must admit the fault must be on my side. I tried to connect to my Provider T-Online with STinG via PPP but unfortunately didn't succeed, although you were so kind to send me some config-files for STinG and T-Online. With CAB + PPP-Connect I managed the connection within 5 minutes and as lazy as I am .... well, you know what they say: Never change a running system ;)

P> It's sad some people fostered that impression of STinG, made me think it might
P> have been a better idea to get it as (virtually) bugfree as it is nowadays, be-
P> fore releasing it. But I'm sure not many people would agree.

I think the point was that most of the people urgently needed a new package for a PPP-connection. And STinG fills the gap for many people as I heard. But if you live in Germany and T-Online is your provider, and you're willing to spend money, you must agree CAB+PPP-Connect has got the huge advantage to be pre-configured for T-Online. You just have to enter your name and your passwords and you're ready. That's especially useful because you don't get the best information from German Telekom. To be honest, I was unsure what to fill in at STinG's dialer-config, because you just get lot's of numbers and codes from T-Online :(That's their fault - not your's.

From: outrider@anv.net
Message-ID: <66ap17pou1@usenet85.supernews.com>
Source record: 112466

I just received CAB 2.5 from Systems For Tomorrow and have been playing with it for a couple hours.

Wow!

What a nice upgrade. The first thing you notice is the speed. It's much, much faster than even 2.0, especially in loading graphics. And even while it's loading pages, it seems much more responsive. It seems like you have installed an accellerator. Everything just seems quicker and more responsive.

One nice new feature I really like is the ability to right-click on any graphic, which brings up the file selector, allowing you to save it anywhere with its original name already in the file selector. No more 000000d3.jpg files and no more searching through the cache for graphics (though it has nice utilities for doing that, too)!

Another nice feature is that it shows the bytes/sec rate in the status line. Very nice for the larger files, allowing you to see just how fast you're getting data.

It comes with lots of other nice little goodies, too, but I'm just getting started. Suffice it to say, I'm _extremely_ happy with my $49.95 investment. I can't wait for v2.6 to hit the English streets.

OBTW, I still haven't tried PPP-Connect. Peter's STinG is working so well, that's way down on my list of priorities. I'll definitely give it a shot this weekend, though. But given the lack of support for it, I won't stick with it. I just want to see how well it works. From looking at the docs, the interface looks very nice and user friendly. (Of course, BubbleGEM is there to help, if needed.)

>hardware itself is unstable.

Terry, PH player crashes my TT using MagiC 4.0 - so it is not a Falcon specific problem :) - it works fine using Geneva on the same machine using the same set-ups

Steve

Just make sure it understands Hayes commands (99.99999% do!). If your serial port is unmodified there is no point in getting a modem faster than 14k4.

Hi Terry

Are you sure you are using the DSP cab_jpeg.ovl? I can't remember the dates
etc. off hand, but be aware that there are *two* jpeg.ovl's out there for
CAB. One uses JPEGD.PRG and the other doesn't use the DSP at all.
Both are, I believe, available from Flinny's page:
http://www.flinny.demon.co.uk/

CyberSTrider is on the lookout for a programmer with Lattice C and Devpac skills. We are currently looking at a project which will probably take a month to materialise and 2 months to fully bring to market.

There is an urgent need for a programmer so do get in touch if you think you may be able to help.

More details about the project and renumeration from CyberSTrider, via email...

Regards
Danny

>in the background.

Ok, but what is CAB doing whilst the module downloads data: nothing.
The module just allows you to scroll in the page while a download is
in progress. In fact, this is possible with the STiK-OVL as well
altough it doesn't use threads but gives program control back to CAB
when it waits for data.

There are two possibilities to do speed-up:

- progressive image-displaying:
quite hard to do, but possible
- finally, and this is much easier: doing
download with multiple connections

Greetings

Daniel Schaller

Im a die hard Atarian as well, but it gets tiresome to see posts of
this nature. When I first read his post I fully expected to see a
dozen or more posts directly challenging his statements, and was not
dissapointed.

I wonder when, if ever, people who own older more obsolete hardware
will somehow admit that it is truly just that; and stop trying to make
excuses or defend the purchase.

The Falcon may make a passable internet machine...but compared to
other more modern platforms, it just cant compete. To use someone
elses point, I think the Falcon is about the best platform for running
an internet connection on released in 1993...and thats as far as Id
go. Comparing any of the Atari browsers to any recent version of IE
or Netscape is laughable.

Just another couple o cents.

Joe

Now that I have Magic I've been able to try aFTP, but that still doesn't
seem to pass on the EOF. And to make matters worse, I've not been able to
get STiK working reliably under Magic. I've got it working again under
TOS 1.62 but not under Magic v5.

It seems as though I'm bound to using STiK and TOS for uploads, before
swapping back to Magic and STiNG for downloads. It's a bit of a pain, but
ATM that's the only way I can get it to work.

Looks like I was a bit wrong with the compiler. I'd tried all the programs
that I'd compiled before installing Magic, and they worked when set to
single-task and given a restricted memory allocation. The compiler itself,
well that's another matter. No matter what I do, including patching it, the
compiler just doesn't want to work. :(

Looks like I'm going to have to translate the Basic programs to 'C', or
assembler, so I can get them to work.

Hi Roger and all the other helpful Atarians out there,
I'm so glad you came to my aid. You guy's are like the third
emergency service for people like me. I was on such a high when I clicked
on "Partition Info Only" and the two missing partitions returned.

Just lately computing for me has been like playing snakes and
ladders. At the moment I'm halfway up a ladder and hoping to carry on
climbing, there's been far too many falls of late.

Thanks again, and all the best
Mike

Hi !

I still have problems with Audio Tracker Demo by Sound Pool. (BTW, I have sent them 2 Emails in the past 2 weeks, and ... still no answer !)

When I create a tape, no problemo until the very End when the Falcon wants for some reason to access B: (????)

I use CBHD driver. Somebody mentionned that soundpool recommended the use of the Atari HD Driver. How do I replace one by the other without reformating ?

Thanks,

STeph

I don't use it that much, either, but occasionally it does come in handy. And the docs are not exactly complete, so it's not always a case of not RTFM. :^)

>My absolute favorite feature in CAB 2.5 is the 'Ad-Buster' module
>that keeps you from wasting time downloading the web page ads that
>we always wished we could get away from.

Strangely, I haven't tried that yet, but will do so today.

Perhaps my favorite feature is the download module. That is so cool, being able to download files in the background, with their original filenames. I was downloading about 10 demos yesterday, all at the same time, while still surfing in the foreground. And later I was downloading a bunch of other files at the same time, while surfing in the foreground. That is such a cool feature. No more staring at the screen, waiting for a download to finish.

I also love the ability to save any graphic, such as a cool icon, just by right clicking on it. And again, you get the original filename instead of something like 0000006d.jpg.

Oh, and lest I forget, ESPN's SportsZone now looks just fine! No more text/picture alignment problems. I frequent another site (www.unlvrebels.com) that still has that problem, though.

Thanks...I got it last night and will check it out today. Probably
won't stick with it, though, since it doesn't handle progressive
JPEGs (JPEGD's fault, I'm sure).

Thanks Roger,
Well I guess I'm on to the next stage now.

I downloaded CBHD5.02 today. It looks a pretty comprehensive prog.,
maybe too much for my limited knowledge. Add to that the German docs!
another headache.

I tried putting CBHD and SCSI Prgs. in turn both with PRG and SYS
extensions in C Root directory with no results. I guess it needs
customising in some way. At least I didn't lose a couple of partitions this
time, no snakes at the moment, just stuck on the ladder.

Any info on the set up would be greatly appreciated.

Thanks

I've been using Atari computers since 1983 and I don't recall any model that had a cartridge type modem. There were two versions of the Telelink terminal program on cartridge which were for use with a modem. But the modems themselves connected to the computer through the joystick ports or through an RS-232 port (Atari 850 or ICD P:R: Connection interface). There was also a later modem for the 8-bits called the XM301 which plugged directly into the I/O port on the 8-bits an was powered from the computer.

If this is what you're looking for, then let's take this discussion to comp.sys.atari.8.

STonX? Yes, I thought about that, but what I had in mind was
something more native to the hardware. Running X alone on a 4 meg Sun
3/50 is difficult enough without running an actual application in it
;). I was referred to the FENIX project by email. It has potential.
I realize that it would not be an easy project, but it has to be
easier and faster than software emulation. It almost works out to be
the equivalent of an 68020 based TT system. Heck of a lot cheaper to
boot.

Well - doesn't the usual midi-timecode-sync-thingamabob do the job? I haven't actually tried 2 falcons, but I have tried 1 falcon + cubase Audio & 1 Logic Audio PC and it works if you fool around with the sync-settings... :)

Helas, stupid people always exist on both sides ... I really prefer to
be on the right side even if I seem not too friendly ... when it's
question of money nobody can make change my advice.

Experiments are the best things which could happend in your life, money
is the badest one ... and happily it doesn't exist anymore when you die ...
perhaps is it an approach of the truth.

Always? Given your success with other access methods I would suspect
the actual mail-server. It may be overloaded. Have a chat with your
ISP first. Are you sure you are using the correct address for the mail
server? You could use STiNGs Find Route to see just how many "hops"
you are having to do to connect to it.

Avoid these "Windows" printers (like the Lexmark etc.) - they make plug-and-play easy for PC owners but are a pain in the butt if you don't use Win 95.

I've heard very good stories about the Epson Stylus range - you ought to get a good deal on a second-hand device. The PC people keep chucking the things out to buy the latest model.

Hi,

OK, I've bought a TT. I am letting Karen use my ST and I have a question. I have a lot of commercial software that I bought fair and square, that had the boot-sectors overwritten by a virus many years ago (I suppose I'm a pack-rat, I didn't trash them, or contact the companies when it first happened). I'd like to make them available for her to use. My question is: If I were to find someone willing to send me a copy of their boot sectors, would that be considered piracy? Naturally, the majority of these disks are games, which is why I didn't worry about it - I'm not much of a game fan. But I did pay for them, and would like to be able to let her use them.

My understanding is that this is perfectly legitimate. In fact, The
Ultimate Virus Killer comes with a large database of bootsectors for
precisely this purpose. If you have UVK, it will restore the missing
bootsectors for you.

3634. Check out info on Clik Drive

Newsgroup: comp.sys.atari.st
Date: 1997-12-07 00:00:00 UTC
From: Eonic Man <eonicman@erols.com>
Message-ID: <348B31FF.199A19DB@erols.com>
Source record: 112362

Hey guys,

Looks like the floppy will soon be terminated. There is a new device being developed by Iomega called the Clik drive. It holds 40 megs and is about the size of a match book. Perhaps when this becomes available, one or two of these drives could be installed in the floppy drive bay of the C-Lab Falcon MK-X. This would allow for an easily trasferrable medium for music production. Font families can reside on specific disk for desktop publishers. Virtual synthesizers (in the form of samples from a specific synth) for midiplay can reside on a Clik disk. I just hope that this new medium will be supported on the Atari platform when it becomes available. I think it will be great. BTW, once Mpeg-3 audio players become available for the Falcon, you would be able to store 9 compressed Audio CD tracks on a Clik. 130 tracks can reside on a standard CD-ROM. Mpeg3 takes a 50 meg Audio CD track (roughly a 4 or 5 minute song) and compresses it down to 5megs without any loss in sound quality. This would be great for those using Falcons for professional audio production. Perhaps multisession can be applied to storing audio Mpegs on CD-ROMS for archiving the music that you've worked on. Let's say that your average client wants you to work on 10 songs. You can save the resulting tracks from 13 clients on one CD-ROM. PLEASE someone create an Mpeg 3 Player for the Falcon and a utility that converts Cubase Audio, AVR and WAV files to Mpeg 3. Thank you.

Peter Ross

My mail server takes about the same amount of time when sending (sometimes even longer). It could be that Willard's mail server automatically redirects to another one. Since my ISP started doing this, the NEWSie pauses have become longer (although not bothersome). I'm running under STiK, though.

Why do you spread such nonsense ? I can very well view the mentioned URL,
i.e. http://www.asienhaus.org/, no problems to load that page, which
would not be possible if there weren't any DNS entry for it.

I never use proxies and I'm 100 % sure the page was not in the cache.

Poor frustrated bugger ... ;-)

My good ole 520ST is a well Internet capable computer. It has only a 68000 (Falcon a 68030), clock is 12 MHz compared to the Falcon's 16, and it only has 4 MB RAM, while this guy's Falcon has 12 MB.

So what made him come up with that conclusion ???

Hi Jos

Nice to see you here. I downloaded the package, but have yet to unpack
and try it. Judging from what I've heard it'd make a great mail / news
reader, but I understand other programs have to be used to download the
mail and news ? Any ambitions to put in STiK / STinG code for accessing
POP and News servers directly via the net ?

> If you are confused with this situation and unsatisfied with it,

What were the problems communicating with the maintainer of the official
version, that prevented from merging the versions ?

Cheers Peter

Terry,

It's not piracy to "resucitate" a virus-infected floppy. You own
a copy of each of those games and that's what counts. Of course,
anyone sending you the bootsectors (how would that work, anyway?)
would have to trust that you _really_ do have the games, but that's
a
side issue.

Greg

No matter what you try to explain to him Ronald I think he won't understand so I'm replying on a PC for him. Yes it's true that there are more browsers on a PC but at 100 megs plus for each options you choose to install if this is what you call great well go to it. As for graphics on a PC that sucks a big one totally. I get great graphics on my Falcon all the time with Cab something I can't say on my Pentium. If I didn't know better you sound like a famous advocate friend of ours coming out with dumb or untrue facts about Falcons in general. If you ain't and you really need help to figure out your Falcon to see it's true potential then all you need to do is ask and you'll get all the help you need. Otherwise if you believe that a PC or Mac is the route for you then by all means go and buy one and then you will know what a mess you really have on your hands. I know from experience that it was definitely easier to operate my Falcon !

3650. ST+ 25 NEWSFLASH!

Newsgroup: comp.sys.atari.st
Date: 1997-12-07 00:00:00 UTC
From: <>
Message-ID: <34900be6.55832496@news.zetnet.co.uk>
Source record: 112421

ST+

As from Issue 25, ST+ (due for release on the 7th of February) is changing format to an A5 paper based ATARI Fanzine,

The people responsible for putting the diskzine together every month for the last two years see this as a progressive step forward,

As always ST+ will be released regularly on a 4 week basis,

Subscriptions will not be asked for or accepted, this is a pay when you want it publication, The cost for the fanzine will cover the production of the pages and postage, there will be a guaranteed 20 pages each issue, It is felt that the page count would never go this low, but will fluctuate from issue to issue, thus a minimum page count has been decided upon,

The price is set at one pound per issue, If reproduction costs can be cut then the price will lower, But should not rise above the 1 ukp mark, I think it goes without saying that this is a hobbyist venture and not one single person will make any money from it, not the producers or re sellers...

T.U.S. - ALIEN TECH - TITAN DESIGNS - and many other commercial companies as well as Goodmans, Floppyshop and ATARI Computing all advertise in ST+ Diskmagazine, it is hoped that these companies will take up the offer of FREE advertising in the all new ST+ Fanzine, If you have an advert then let us know now..

Reader/User input is of course hoped for, the page count is guaranteed no matter what.. But if we can get you the reader to offer articles and reviews, then they will be printed and the page count simply goes up..

For more information why not pop along to the ATARI ST+ Fanzine web pages, http://www.users.zetnet/paxton/stp/index.html these are separate from the ST+ Diskmagazine web pages where support of the current and back issues is and always will be available,

Every issue of the ST+ Fanzine will be published as an HTML file on the ST+Fanzine web pages, but exactly one month after the paper issue is released,

.
Information posted By Tony Greenwood, I will be a contributor to ST+ and will also run the web pages, for editorial policies and anything related to the actual ST+ Fanzine you must contact the editor Dave

Hollis... email DHolli00@allatsea.demon.co.uk

3651. TT and video card

Newsgroup: comp.sys.atari.st
Date: 1997-12-07 00:00:00 UTC
From: leaver@netinfo.com.au
Message-ID: <881469072.713871@wilma>
Source record: 112422

I have a Matrix Coco card and 17" mutlisync monitor which I have been using for some time in my Mega STe. The combination produces a beautiful, rock steady picture. I use NVDI 4.11 with the Matrix cxx stuff.

I have recently acquired a pre-loved TT and I should like to transfer the Coco to the 'new' machine, but I can't get it to work. The display flashes on and off, much more off than on, although occasionally the screen can stay lit for as long as a second or two. The picture, when I can see it, looks correct and I can do things like select menu items, albeit painfully.

I have had a peer at the card's output on my ancient, el-cheapo oscilloscope when the card is installed in the TT and in the Mega STe and can detect no obvious difference. Since the scope can only handle 10 mhz on a good day I can't be certain about the RGB signals but in outline they look the same. It may be that the duration of the VSYNC pulse is shorter on the TT but I can't be certain. The magnitudes look similar. There is no sign of any signal flashing on and off, but clearly there is some difference that is critical.

Is it possible that I have an over-loaded power supply problem? The TT has 4 meg of ST ram in what I take to be an original Atari installation (32 chips), 32 meg of TT ram in one simm in an aixTT card, a I gb Connor drive plus floppy. Everything else works properly, with or without the Coco card installed. The monitor works perfectly when connected to the TT's VGA socket. I have measured the voltage on the Coco card when in place and it appears to be a good solid 5 volts.

A long-shot which has occurred to me is that the TT's video output may be interfering with that of the card in a way that I can't detect on my scope. On the mother board underneath the VME slot, toward the power supply are some electronics including a wire-wound coil that look as though they may have once been covered by a cage - they are surrounded by a rectangle of earth track with a hole at each corner. Does this mean anything to anybody?

The previous owner assures me that the VME slot was working.

Can anyone help me?

David

Source record: 112423

On 6 Dec 1997 05:49:27 , Terry May wrote:
|I just received CAB 2.5 from Systems For Tomorrow and have been
|playing with it for a couple hours.
|
|Wow!
|
|What a nice upgrade. The first thing you notice is the speed. It's
|much, much faster than even 2.0, especially in loading graphics. And
|even while it's loading pages, it seems much more responsive. It
|seems like you have installed an accellerator. Everything just seems
|quicker and more responsive.
|
|One nice new feature I really like is the ability to right-click on
|any graphic, which brings up the file selector, allowing you to save
|it anywhere with its original name already in the file selector. No
|more 000000d3.jpg files and no more searching through the cache for
|graphics (though it has nice utilities for doing that, too)!
|
|Another nice feature is that it shows the bytes/sec rate in the
|status line. Very nice for the larger files, allowing you to see
|just how fast you're getting data.
|
|It comes with lots of other nice little goodies, too, but I'm just
|getting started. Suffice it to say, I'm _extremely_ happy with my
|$49.95 investment. I can't wait for v2.6 to hit the English streets.
|
|OBTW, I still haven't tried PPP-Connect. Peter's STinG is working so
|well, that's way down on my list of priorities. I'll definitely give
|it a shot this weekend, though. But given the lack of support for
|it, I won't stick with it. I just want to see how well it works.
|From looking at the docs, the interface looks very nice and user
|friendly. (Of course, BubbleGEM is there to help, if needed.)

Terry,

I whole-heartedly agree with everything you said... well, except
for the bubblegem thing... I don't use it because that's what
documentation is for. <G>

I set this puppy up and began pulling my hair out for about six
hours because I couldn't get IConnect to work. It would dial, but
hang on the first command. Just for the heck of it (after 6 hours)
I reloaded the original factory setting on my modem. First time
out of the gate after that, I connected up to CIS and sailed right
through the whole process and was browsing in seconds!

My absolute favorite feature in CAB 2.5 is the 'Ad-Buster' module that keeps you from wasting time downloading the web page ads that we always wished we could get away from.

I'm still waiting for support for cookies and a JAVA interpreter, but I'm not holding my breath. <g>

Take care,

Joe Mirando @ STReport

It's not that easy, you would have to redirect all the hardware calls,
etc...

You might be interested in the STonX emulator. There's a link to it on
my web page.

IIRC their e-mail address is wl@inx.de, the problem is that they never reply
to either this address or mail sent to Konstantin Woller personally.

N.AES is still being worked on, but I don't know when 1.2 will be released.
It sounds like a big improvement though, with real-time scrolling of
windows, better multi-user support and increased speed (is it possible??).

Sounds nice, I wish I could afford it... But the upgrade alone costs more
than CAB 2 did in the first place :-(

> I'm still waiting for support for cookies and a JAVA interpreter,
> but I'm not holding my breath. <g>

The latest beta of the CAB.OVL for MiNTnet supports cookies, so it's really
up to Dan Ackerman :-) CAB 2.7 will also manage cookies, but will still be
dependent on the OVL for this.

> download with multiple connections

Downloading with multiple connections is not considered polite in the
new world of overloaded web servers. Instead, use HTTP/1.1 with reusable
single connections. The speedup is still good and the network load is
reduced, at the same time. The MiNTnet OVL 1.83 already supports this.
I have just released 1.84 with full cookie support and partial authorization
support to my beta testers yesterday.

re: progressive display - I'm working on this in the next MiNTnet OVL.
You must be using a Minix filesystem for your cache to use this feature.

Here's how it works:
CAB tells the OVL to retrieve a file and place it in
a particular filename.
e.g. D:/CACHE/a/00001234.html
The OVL creates a pipe, and a symlink to the pipe, at the
cache filename location. It also creates an actual
file at a nearby location.
e.g. U:/pipe/cabovl.123
D:/CACHE/a/cabovl.123
D:/CACHE/a/00001234.html -> U:/pipe/cabovl.123
As the OVL begins downloading, it writes to both the pipe and
the alternate file. It then returns "success" to CAB.
CAB opens the cache filename, which is a symlink to a pipe,
and starts reading from it. So, it gets the downloaded
data in realtime, as it arrives.
When the OVL is done downloading, it closes the file and the pipe.
Closing the pipe gives CAB an EOF. CAB closes the pipe too.

The OVL renames the alternate file into the original filename, thus
removing the symlink at the same time.
e.g.
Frename(0, D:/CACHE/a/cabovl.123, D:/CACHE/a/00001234.html)

This could be implemented more cleanly using a patch to the Minixfs driver
itself. I've been thinking of writing that up, but haven't yet. The idea
is this: set an Fcntl on an open file, such that reading from the file can
not return EOF if some other process has it open for writing. This way,
one process can read from a file at the same time another is writing it; if
the reader tries to read more than is present, it just suspends until more
data becomes available... It's nearly the same as the above, but avoids the
mess of multiple filenames and handles...

Java interpreter - would be nice, not likely any time soon.

Cookies - fully supported in the MiNTnet OVL.

I don't remember the specs of those drives, but be aware that if they use calibration, cubase probably won't be able to read/write from them.

> How many tracks playable at once....
I would say 8, if the partition is not too fragmented. 4 minimum.

> what brand/version of hard drive software...
Well, i personaly used ahdi 6.061 and moved to hd-driver7. No major troubleshoutings.

> what audio recording program...
You have the choice... If you want to record in sync with midi, cubase is a must. For stereo recording/editing, i'll recommend Studio Son v2+ (It's totally freeware since 2 weeks!) or Audio-Create 3 (free). Of course, lot of commercial proggies are just excellent: all soundpools software, quincy, etc...
Bye.

I think it's possible because I have had the same problems with a VME
Crazy Dots cards althought it didn't appears so quick, my monitor
became to show strange lines and switch the palette to different
colors after having used it half an hour, but sometimes it did flicker
just after the boot, I though it was the monitor and then put it to
the computer shop who didn't find anything wrong about it ... a few
months after (and during all this time, same graphics problems :(),
the power supply gave up I must say I have aixTT ram populated with
2x16 Mb simms and a Quantum LPS 850 ...
So at this time I decided to put the TT in a Tower ... the now well
knowed WoodTTower ;) ... after having connected the TT board to the
brand new power supply I never had problems like before !

It was the TT power supply which was to weak !!!!!!!!!!

So perhaps is it your problem !

Let's hope it's that !

>are not that expensive either. What is expensive is all these updates
>that they charge for....

I *don't* have a problem with commercial software at all! I simply stated
that PPP-Connect clients won't be free because ASH aren't releasing
programming docs. Whereas STiK/STinG clients are free (POPwatch is
charityware). A lot of people with Atari's probably are very interested in
cheap, affordable, free software.
I booought CAB2.5 at the last Atari show here in England, and paid top dollar
for it. It wasn't *any* cheaper at the show than if I'd ordered it via post
(and that includes postage). I actually get all the latest CAB betas anyway
from Alex, so what I bought was actually *older* than what I already had sat
on my hd. I think Alex deserves the money for CAB becuase it's brilliant and
he put's a hell of a lot of work into it. So I bought a copy!!

I *don't* agree with ASH's idea of PPP-Connect. STinG is *better*, works,
and has more clients, and the programming docs are *freely* available.
ASH is trying to corner a market, and you can't blame them for that, it's
business. But I don't *have* to like it, or agree with it!

I personally feel that the average Atari user is going to stick with STinG
for tcp/ip than ASH's (or any other newcomers) stack.

What really pisses me off though, is (like you say above), the *expensive*
upgrades. I bought CAB2.5 (am currently running CAB2.7 beta). If I want to
upgrade my *official* 2.5, then it's going to cost. A lot of money!
HD Driver is a similar thing. I had 6.00, but the upgrade to 7.02 cost me 15
quid. I saw very little benefit from it though. I just always like to be
running the latest version. 15 quid still seems a bit steep to me.

>I think we can't continue with this "anti comercial thing" which many
>have or we wont see many major applications in the future. Freeware
>is not always better just because it's free!

I like to moan :) If people like you don't like that then tough!
I *don't* have an "anti commercial thing", I've spent a lot of money over the years buying commercial software. A lot of Freeware, PD stuff *is crap*, but a lot of it *isn't* and is at least as good as commercial software (I know, I write some of the freeware stuff <g>). But if I can get a good freeware/shareware solution then why should I buy a commercial one? I'll certainly buy it *if* it's better, but otherwise *no*.

It was a great idea to put the Appletalk port on the Mega STe, TT and Falcon. Atari just never did anything with it which was down right stupid, networking computers together is a huge selling point for schools and small offices, Atari shouldn't have left that half done like that.

Curt

Here we go again.

Issue 51 of ICTARI is now available at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those who don't know, ICTARI is the monthly(ish) disk-zine
for Atari programmers at all levels. It also needs help in the
form of contributions to survive.

This one's actually quite good, there a couple of "scoops" in
the form of a letter about GEMMA from Paul Jones, it's creator,
and the Cadenza Address Book with full sources. Thanks to all
the folk with STOS WEB-sites, they were really useful for
answering the queries of our latest subscriber. Tell your
'net-disenfranchised friends.

Have Fun,
"Augeas"

From: PeterPan <peterpan@cheerful.com>
Message-ID: <348C1452.465D7971@cheerful.com>
Source record: 112246

Hi,

I'm Randy Constan, formerly of Elfin Magic Software. It's been a while since I had any ATARI
products out, but I still like to use the machine quite a bit.

Anyway...

I just installed the Gemulator on my PC, and have a mountain of files to move. Unfortunately, I have
a big 350Meg drive on the ST which was formatted using ICD software, so the PC couldn't read it,
even if I had a SCSI card (Which I don't). I was hoping to move large segments of the drive with my
old TURTLE (v.217) backup utility, but it doesn't work right unless it's backing up whole partitions. The next best thing would be to just batch upload folders at 19.2 K baud, and let it
cook overnight. Ideally, a "Laplink" for the ST. Is there anything like this out there? Hopefully
PD? If not, a disk backup utility that can recurse sub directories, and doesn't crash all the time
would be the next best thing. Ideas?

What hard drive did you buy and what driver are you using?

From what I hear CAF may get worked (or is now as a part time thing) for
some fixes early next year. But don't expect to see anything real soon.

They are very busy with VST PC, VST SGI, VST Mac. Studio Module has yet
to be ported to the Mac.

>no experience with them.

Well, that just sounds too expenive. Heck, I'm not going to shell out $200
for RAM when I paid $30 for the machine! I may have a lead on a bigger hard
drive, but I guess without more RAM, I might as well forget it.. Same with

the video card: 640x480 X11 is not that great, get video card, requires bigger monitor (unless the PTC1426 will do 800x600), etc.. Just too much money (I was thinking of almost getting completely out of the Atari world until I found this beast).

>Good luck, oh! you already have good luck, humpf!

Would you be happier if I sold my Mega4 cheap?

Hi Steve!

b>>> Do you have any experience or advise as to which scanner (A4

D>> I've got a Microtek Scanmaster E3. It works well on this Falcon.
SS>
SS> Is that a flatbed?, is the driver software specific to that individual
SS> scanner, i presume its a SCSI device.
It is a SCSI flatbed and the driver software is specific to this and the
similar E6, however Homa Systems House has drivers for other scanners.

The E3 is about the best "bang for the buck" here in the UK at least, the
driver can be installed as a GPDS driver so you can scan directly into such
as OCR and art packages etc.

Speak to 'ya later!

Actually, it's a feature of the operating system, not the application
program. If the program doesn't use OS calls, that would explain
why the method doesn't work.

Cheers!

Actually, the ZIP is supposed to be the floppy-killer. <grin>

The Clik is intended for mass storage for portable low-power devices
(i.e., digital cameras, PDAs, etc.) in leiu of pricier and smaller
capacity memory cards.

The problem with any of the intended floppy replacement technologies
is that the single media cost is still too high (although the cost per
megabyte is less than floppies). Until a device arrives with large
capcity and media cost of less than about $2 a pop, I think the floppy
will be hanging on (at $9.95 per disk, the Clik is still some distance
away from that).

Spiros Polikandriotis <akanthos@matrix.kapatel.gr> wrote:

> Does anybody know if there is going to be released an English version of
> N.AES?

Doubtful :-) However, English RSC-files is freely available on the net, so it's not much of a problem.

> Is N.AES better than MagiC?

That depends on what you need. MagiC is easy to install and maintain, and runs GEM-apps really fast. N.AES is just as capable for running GEM-apps, but has the advantage of running on top of MiNT and can therefore run together with MiNTOS. This gives you a extremely powerful and versatile OS (unix and GEM at the same time), but it needs more RAM and disk than MagiC. Also, MagiC is a complete OS while N.AES runs on top of MiNT which again replace parts of GEMDOS. So if you have TOS 1.xx, then go for MagiC.

Basically, if all you need is GEM-apps then MagiC is easiest, for a more advanced setup N.AES is best suited. E.g. if you like to use GCC, set up a network with shared disks and printers, use pine or NcFTP, then N.AES is what you need.

As for compatibility MagiC and N.AES is equally good. Both run all clean apps without problems, but beware that some of MagiC's AES-features is a little different than Atari's (and N.AES) so some apps that's not designed with MagiC in mind can look a bit odd. Nothing serious though.

And beware that many Falcons has big problems with MagiC, so if you have a Falcon then try before you buy. Does anybody know if there's a demo-version available?

I think most of us know that it probably wont be very fast, but it would
still be nice to be able to use it. There are also faster TOS boxes then
the ST.

What I would think would be more interresting and more useable would be
JavaScripts for CAB.

The Cookie manager in the MiNTnet OVL works with all versions of CAB, back
to 1.5. Likewise for authentication and authorization. The only thing CAB 2.7
provides in this case is the ability to save cookies to disk and reload them
in a future session. I.e., the OVL keeps all cookies in memory, and throws
them away when it exits.

>Please either post an answer or e-mail me at defranco@mail.hooked.net

A long long time ago I used my Alpha Systems SwitchBack on my Mega ST and
decoded the copy protection on Dungeon Master, so that I could copy it to
my hard drive. It was so long ago that I can't recall exactly what to do,
only that I did it once... There were some problems; the program loads into
an absolute address and certain hard disk drivers that also loaded into
low memory were too big. I.e., the game would load on top of the hard disk
driver, and things rapidly degenerated from there. I was able to run using
an ancient version of the Supra hard disk driver; the ICD driver was too big.

The program was pretty interesting, it loaded in multiple phases, with the
main program being a compressed file that self-expanded when it executed.
The copy protection involved reading a particular sector of the floppy which
was written in an odd format and would always return a particular error. I
had to remove that by tracking down floppy access calls and NOPing them. I
also changed the text references to the A: drive to C:, so it could pick up
its data files and saved game files. I used SwitchBack to save the expanded
binary to the hard drive, and patched it from there. It loaded a heck of a
lot faster after that. Wow, thinking of that really takes me back. That was
also the project that got me started writing my own disassembler. Too many
sidetracks in getting something done... I would disassemble the code, patch
it, reassemble, and try to run it. Thrills & chills...

Currently my Mega ST is a heap of loose cables and boards in a rusty old
tower case; I haven't even turned it on in years. The hard drive itself is
probably frozen by now. Sorry, I can't help you but perhaps someone else
with the proper setup can.

I think it's a bit funny that so many has got such a big problems with
programs which are commercial. If they are good why not buy them? They
are not that expensive either. What is expensive is all these updates
that they charge for....

I think we can't continue with this "anti comercial thing" which many
have or we wont see many major applications in the future. Freeware
is not always better just because it's free!

: signum II (on an atari 1040st) to/on a PC ? Is there any emulator to read
: the atari-formatted disk (3,5"). At least we would need an ascii-file.

The disk-format shouldn't be a problem, Atari uses PC-formatted disks.
You'd have to run an emulator with Signum to convert the text files
to ASCII though, or use a converter (does one exist?) or find someone
with an ST and Signum II (ahem, that migh actually be me...) to convert the
files for you.

Interesting topic, this piracy stuff.
Okay, so what if

Ex 1)
You have the original distribution of a software package and have some one 'patch' it or 'hack' it (these two aren't really very far apart) to be able to install and use it on say - some hard disk drive or a CD-ROM? Someone wanna discuss this?

Or 2)
You see a very nice piece of software done on another platform, say a Wintel system, and decide to
port it to some other system, like your ST - provided that you have the technological know-how. Using
an emulator, this is perfectly legal, but hacking and recoding the software? What if you say, it's a
dedicated emulator dedicated only to that particular software. Hmmm.. Like some gameboy emulators
on PC-contemptibles. Perhaps a nice niche market for some crackers out there - crack/port a game, enhance it for use on , say, a Falcon, and presto! you're in business?

Or 3)
Some arab 'hardware pirates' have cloned the VCS2600. It comes with over 3,000 built-in games (well at least that's what the article in ST Format states). What if you're playing a legally acquired 2600 game on that machine? Is THAT illegal (because you're using 'illegal hardware' - compare this to what some telephone system companies are doing.... quite a striking resemblance wouldn't you say? Especiallt when it comes to some kind of standard that is taken from another... hmmmmmm I have not enough expertise on any of this. They're just provocative thoughts. Come'on y'all out there - I want opinions! :-)

>"If it's NEW, it must be IMPROVED, right?" <bzzzt!> :-)

Actually.... I still have an old Epson Stylus Color (old model, the first ever) which I find - especially within netwrok environments is a lot easier to handle and much more stable than successors such as the Stylus Color II, IIs and 500. Besides, my old Stylus Color has about 56K of buffer memory, the other ones mentioned here have far less. And they use the same ESC/P2 Color printer language. With the same data compression commands. These are just light-weight alternatives based on cheaper production and have a lot of moving parts which can cause trouble. On the other hand.... I'm looking forward to the Stylus 1520 and 3000 models...

Yes this is a problem. ASH realy get what they can and a bit more...

Someone showed me how much it would cost you if you bought version 2.0
and upgraded every time you there were a new update.... EXPENSIVE!!

Minor updates shuld be for free and major updates shouldn't cost an arm
and a leg as they do now.

I have been keeping an eye on this - the DNS has now appeared on the nameservers, and I was able to access it using CAB1.5, CAB.OBL 1.2704 and STiK 1.12

I have also been able to access it using Netscape and MSIE.

I call there for Atarinet every day and rarely have a problem. I'm sure
Kev's not planning on leaving as he's just take on ZC for NeST.

> You may be thinking of Daron (STUN), Peter. He seems to have pulled
> all the plugs and BT have certainly pulled his phone line. I am left
> high-and-dry with no NeST connection!

Daron's had to go all but off-line for a while and the change to Kev
Osborne as ZC for NeST was worked through in the NeST admin echo. Given
that it's a long call from Manchester, you're more than welcome to poll
my system - Keith's Point - in Derby. I take Fido (local Hub), NeST,
Atarinet, Turbonet and FANfiles. Call the BBS on 01332-662988
(V34+, 24 hours) or crash me a netmail with a password and I'll set
you up as a link.

Message-ID: <348C28B6.64D3@cip1.uni-hannover.de>
Source record: 112313

Hi everyone,

I need you help in a 'discussion' I'm going trough with Steinberg these days. I noticed that they've stopped developing Cubase Audio Falcon some time ago, and I noticed that CAF still does not support SCSI Initiator Identification. This means that you can't use modern Hard Disks for HD-Recording...
So I wrote some mails to Steinberg, and all they told me was that it's my own fault to purchase old software and the wrong hardware. After some discussion, I was forwarded to a CAF programmer who argued in the same way, but today he told me he would bring up the topic 'SCSI problems' while talking to his boss. He also said that he couldn't promise any results, but at least that's a start.

So I want you to help me. Send those E-mails to Steinberg and tell them to release further bugfixes for Cubase Audio. I think it isn't right or politically correct to sell programs for $1000 and then stopping support after 2 years.

Alexander Selck

3706. Apple Talk on ST?

Are there any drivers that allow you to use apple talk on an Mega STe or
Falcon 030
this would be wonderful, since i've got my mac hooked to my 95 machine with
the 95 machine as the server
and this would allow me to use the mac as a apple talk gateway to eithernet
so then
i'd have the st connected to the mac thru apple talk and the pc and the mac
connected with ethernet
any ideas????
thanks

What have I dodged?

> 1) you claim that Apple is actually turning a profit. How can that be
> when the fiscal year report shows that Apple LOST ONE BILLION DOLLARS,
> with $160 MILLION LOST IN THE LAST QUARTER ALONE?

Lets put this in perspective: $500 million was written off when Apple bought Next.. Secondly, the remaining loss was due in setting aside charge reserves for restructuring activity and the remainder is an operating loss.

Most of the 161 million loss was due to the fact that Apple wrote off the purchase of Power Computing's Mac OS liscence for $100 million. The remaining loss was in setting aside 61 million for future restructuring activities..

Apple created $200 million in cash creation after paying off a $200 million bank loan. Apple created the positive cash flow from inventory runs and investments..

> 2) you claim that Apple is stable. Why, then, did a well-respected
> company accessor recently give Apple a failing grade, and said that they cannot
> sustain any further losses?
>

At least two financial firms have recommended Apple stock for longterm buy. You need to look at their balance sheet to see for yourself..

> 3) you claim that Apple is still licensing the manufacture of
> clones. Other than UMAX's contract which allows them to manufacture Mac
> clones for the Far East, what are the other companies making clones

> (TIFKAS' own words)" Jobs decree of "no more clones". Please provide any
> documented evidence ("because I told you so" is NOT considered good
> enough - we want magazines, page numbers, web pages, anything).

Not again!. I will type slowly this time for meaning and clarity.

Apple has licensed Mac OS 8 to Umax. Umax(supermac.com) along with MacTel(mactell.com), Powertools and APS(apstech.com) sell clones in North America. What do you not understand? Try macsurfer.com and deal-mac.com for evidence. Also check out the firms web page as well as MacWareHouse, MacZone, MacConnection, MacClub, MacMall and Cyberian Outpost..

Do you really want me to post the press releases here? I am itching to
do so.

Umax will bring out G3 models in January.

> 4) why is Petey-boy so afraid to post any of his Mac "good news"
> info to comp.sys.mac or comp.sys.mac.advocacy, which have shown nothing
> of any of TIFKAS' drivel, but the exact opposite? Is it the fact that

> not the copies of MacUser you have in your basement apartment that you
> frolic through naked every night? :)

Again for meaning and clarity.

I stated that if you were to walk into Best Buy that would be the case.
There is a lot of Mac/Win hybrid software in the windows section.

> Just remember these things and keep asking them. Be sure to ask him
> other embarassing questions as well should they crop up. :)

I'm not "anti commercial" at all, but I understand that people reacts to
ASH's philosophy. I have CAB 2.0, which I like very much, and I would like
to upgrade to a newer version. But the upgrade alone costs more than CAB 2
did, because ASH has bundled PPP-Connect with it. A piece of software that
I...

a) Don't need.
b) Don't want.
c) Can't use.
d) Won't pay for.

But if I want to upgrade CAB I don't have a choice. Pretty arrogant by ASH
if you ask me. PPP-Connect might be a excellent product, but it should be
sold as a separate product or bundled with MagiC instead. It's a OS-extension,
not an application.

3711. CDR on Flacon

Newsgroup: comp.sys.atari.st
Date: 1997-12-08 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <66hlio$g0s$1@roch.zetnet.co.uk>
Source record: 112319

Hi Folks,
Does anyone know anything about CDR on the Falcon. I know about CD Recorder Pro, and I need its ability to do both audio (from AVI or WAV) and data in a multisession mode without the need for constructing a ROM image on hard-disk first, but I'm loath to spend 200 UKP (as much as the damn drive almost) on software if I don't need to.

What big problems? And are you talking about MagiC 5? MagiC 5.11 is
VERY stable on this Falcon.

From: outrider@anv.net
Message-ID: <66hmes$qd4$3@usenet76.supernews.com>
Source record: 112322

Well, I gave PPP-Connect a test drive, and came away somewhat impressed.

The interface and all dialogs are extremely nice. Very sexy, easy to use, and very professionally done. It *looks* like a commercial program. I was up and running in just a few minutes. It would have went even faster, but for some reason I couldn't get my modem init line to work, but it works if I just leave it blank.

The next thing I noticed was the speed. It seemed to be a lot faster in action. Not only were my cps rates higher than ever, but I had far fewer delays connecting to and resolving hosts. It really seemed very snappy.

I tried using an online poll that I could never get to work before, and it worked.

Unfortunately, authorization does not work. And, of course, there's no way to use email, newsgroups nor ftp, at least till 2.6 makes it over here.

So STinG is still King, but PPP-Connect shows a lot of promise. I think it's great that we have both to choose from.

I'm sure there was something somewhere about an STe supposedly not addressing 2.5mb properly, you need a program to correct it, I believe it's on an old STF.

> I took the 1MB SIMMs out and left the original ones (2*256KB) there. Now
> my STE won't boot at all. When I turn the power on, there are five
> vertical lines on the screen for about two seconds and then the screen
> goes black (border stays white) and nothing happens.
> What's wrong? Help me and my STE!

Maybe you have physically damaged them, you did remember to discharge all static from your body first before installing them?
Also check you have put them in the correct positions the right way round and securely in place, I have known the simms to be a little awkward when going in and needed a little extra push.
For your sake I hope the simms are ok, if not you'd best get someone to put some in for you, you might as well get the full 4mb before the simms become totally extinct.

Kev.

3716. Joystick Port / Mouse conflict error

Newsgroup: comp.sys.atari.st
Date: 1997-12-08 00:00:00 UTC
From: john.moffat@lion-nathan.co.nz
Message-ID: <881614149.1594359812@dejanews.com>
Source record: 112324

Hi there,

I know there are problems when attaching an autofire joystick to joystick port 0 (mouse) to an ST (Falcon) But recently I bought a Battlestation II arcade joystick unit. When I plug in the cables to the joystick port it locks up all Mouse movement. And if done during a game, it locks out the other joystick movements. It also does not control anything on screen.

It has a switch for Atari 8-bit mode or Sega mode for the 9pin plug. (neither position works)

The only thing I can think of is that the ic's that change the signal from Atari <-> Sega <-> NES put out a funny signal, and I will have gut out all of the internals and then wire it up for only that mode.

Oh, and I 've also just put on a TT keyboard.
This shouldn't make any difference should it ???
I will try my old Falcon keyboard again tonight just in case.

Has anyone else experienced this problem??? It seems different ot the autofire one, as when that happened to me years ago, it simply disabled half of the keyboard, not lock up the mouse.

Any help appreciated.

Cheers,

John E. Cash

>POP and News servers directly via the net ?

No. Okami is an offline reader and should not be biased as to the
method by which news and mail is transferred from a host to the user's
machine.

>What were the problems communicating with the maintainer of the official
>version, that prevented from merging the versions ?

A total lack of communication. No answer to my proposals and bug
fixes. As I wrote earlier, after two years had passed and no new
version had been forthcoming, I decided to make the many changes I had
made available to the people who still wanted to use the program. By
that time, a merger of the two "versions" - the "official", "new"
version is still essentially the same program as the old 0.26 version
- would have been well nigh impossible anyway, because too much had
changed.

The problems only appears on some Falcons, like mine. I have never been
able to run *any* version of MagiC for more than an hour or two on my
Falcon, while a friend of mine use it on his all the time without problems.
Usually it crashes with a "ungultiges blahblah..."-message, even with the
cleanest of clean setups and apps.

Source record: 112375

Is my Atari 520STE dead?

I got couple of 1MB SIMMs (60ns, I think) and tried to upgrade my STE
to one with 2.5MB of memory. STE booted up nicely, but crashed
after installing a RAM disk (in AUTO folder). The first time there were
two bombs and the second time three bombs.

Were the SIMMs too fast? Or what happened?

I took the 1MB SIMMs out and left the original ones (2*256KB) there. Now
my STE won't boot at all. When I turn the power on, there are five
vertical lines on the screen for about two seconds and then the screen
goes black (border stays white) and nothing happens.

What's wrong? Help me and my STE!

On The MEGA/STE & TT030 Homepage, you'll find:

* General Info
- What are the MEGA/STE and TT030 specifications?
- TT-Ram settings to allow specific SIMM combinations.
- When to use SCSI termination on external devices.
- Links to obscure or foreign makers of TT products.
* Hardware Hacks
- Adapter cables for 3rd-party monitors.
- Modem-2 upgrade to allow up to 230k bauds.
* Repairs
- MEGA/STE and TT keyboards manufacturing defects
that eventually kill your Control key.

Thanks to Mario Becroft, Jo Even Skarstein and Frank Lockwood
for contributing some material for my page! ;-)

3736. BBS-Wrestling Door game

Newsgroup: comp.sys.atari.st
Date: 1997-12-08 00:00:00 UTC
From: Frank Gregory <corvair2@bright.net>
Message-ID: <01bd0386$eca85e00$217ad4cd@corvair2>
Source record: 112381

I am looking for an old Door game for an atari ST that was a Wrestling game! This game allowed players to go at it by picking their moves. I loved it back in the late 80's on an atari BBS I used to call. Since I'm about to have a spare ST soon, I thought it'd be great to donate it to a friend of mines BBS so we can play this wicked door game. Unfortunately, I need to find the game first.
Any ideas?

About six years ago, I thought the policy was stupid too. After my
first order, I haven't had problem one from them. They have been
reliable, down to the $250.00 discount they gave me on my Falcon Rack
(which made it in only two days from the time I ordered).
The only thing I can think of, is they don't give away TT Field
Service Manuals:). They will accept credit cards on the second order
without being listed in the phone book. I am unlisted, and haven't had
a problem with that either.
If they don't have something, they tell you upfront, and direct you to
Best Electronics.

I have dealt with B&C Computervisions for over 15 years and I don't
think you will find any dealer you can trust more. Bruce and Cathy,
the owners, are two of the finest people I have ever known. What you
think is a stupid policy is just a way they protect themselves.

3743. CAB 69 Byte Error on JPEG files

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: Mike Saeger <wanda@xnet.com>
Message-ID: <Pine.SOL.3.95.971209214827.16253A-100000@typhoon>
Source record: 112138

I developed a Web page and put it on two different machines. One a Unix machine and the other a Windows-NT machine. When CAB (v2 demo) accesses the Unix machine everything works great. When I access the NT machine I get the 69 byte error downloading the JPEG graphics. Does this happen on the Production version? Is this a STIK problem? Cabovl problem?

Just wondering if this problem was ever diagnosed and resolved?

>Hmm, I bought a Quantum EMpire 1080s, and I use CBHD.

Oh, a new model is it possible to disable SCSI Id with the jumpers?

I use a SCSI3 Microp 4.3 gig. To ensure complete compattibility with CAF
use 512 meg partitions but I do use 1 gig partitions with AHDI 6.06u.
This is a patch version done by SoundPool. Also ICD Pro works good
and HDDriver ver 5.xx-6.xx (7.0x not tested yet) works.

If you want to try 6.06u go to http://ourworld.compuserve.com/homepages/soundpool/

Regards,

Rich

Let me know if you decide to get out again, especially if the TT goes
cheap!

Dan

BTW, I hear the 8 meg ST RAM daughter board is worth quite a bit. Maybe
you could trade the 8 meg card for a 2 meg ST card and 4 or 16 meg card
of TT RAM.

Well I have got the solution for most of your problems. Buy a Nova card.
You
wouldn't believe the speed and resolution you can get out of this baby.
Have you seen Netscape in TC on a Pentium and how nice and fast it
scrolls?
Well the Nova does all that. ComputerInsel does currently sell their
last
stock of Nova adapters for 200DM which isn't much more than a decent
accelerator which can't even get close to a Nova. The only slight
problem
with buying this dirt cheap Nova adapter is that you have to find the
GFX card your self. It's a regular PC Mach64 ISA card and they are not
expeptionell hard to find and when you find one it's very cheap. Around
40DM. So in total that would be around 240DM ~ 100 pounds.

Somewhat related, although I don't run MiNTnet...

A previous version of Dan Ackerman's OVL handled the reloading of pages
very well. I ran across this while updating my own pages: I'd view a page
online in CAB, then find I forgot to make one of the GIFs transparent.
While still connected, I'd quickly fix the GIF and FTP it to the server.
When I clicked 'reload', CAB would only retrieve the new GIF. When
reloading, CAB knew that one file in its cache had changed (probably from
the timestamp).

I think it was v1.2500 that worked this way. When I updated to v1.2618,
under the same scenario, clicking 'reload' would go to the server and grab
everything from scratch (as if Shift-Reload was clicked). For me,
something changed in the OVL. I've yet to try this with Dan's newest OVL.

Is that how a 'reload' should work, with the cached timestamps being
analyzed first?

3751. HELP: HOW TO RECOVER MY HARDDISK!!!

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: cwesterh
Message-ID: <348d40de.337137605@news.utrecht.nl.net>
Source record: 112190

I bought a ZIP-drive and did not manage to get it working. A friend of mine had an old version of SCSI-Tools and GE-Soft and said we could try it with this. I managed it with this and after that ICD-Pro saw my ZIP-drive, could format it and partition it.
A few hours later I put my computer again on. Now the ZIP-drive was not seen anymore. So I tried again and when I was busy with GE-Soft I got constantly time out occured and had to reset. After this my C-partition had disapeard and D till J were C till I. I tried to recover my partition, but now I only have C till G. C shows nothing and the other partitions show rubbish.
WHAT TO DO? There is a lot of valueable information on those partitions (at least for me) and I would like it to get it back and to get it back fast. I do not have backups. In the past I did this with floppies, but I found it to bothersome. One of the reasons I bought the ZIP-drive, was that I wanted to start making backups.
I AM REALLY IN A TIGHT CORNER AND WOULD APPRECIATE TO GET SOME HELP WITH THIS.

A big thanks for anyone who can help me,

Cecil Westerhoff.

In article <EKu8GL.HJG@suse.modem.stud.uni-hannover.de>,
perot@suse.modem.stud.uni-hannover.de says...
> Why do you spread such nonsense ? I can very well view the mentioned URL,
> i.e. http://www.asienhaus.org/, no problems to load that page, which
> would not be possible if there weren't any DNS entry for it.

It isn't nonsense, Peter.. when I checked their nameservers using DIG, a
few moments before I replied with that message, there really was not any
DNS.. maybe they realised and put the DNS in after that.. or maybe their
named.boot file was corrupt at the time.

Is it possible that you have both drives terminated?

When this happens your disks can look like garbage.

Whatever you do, do not try and write to any disk until you
have check this out.

1) Try your system without the ZIP drive.
2) Add the Zip drive back in, but make sure that only one
drive, the last one in the chain, drive is terminated.

Brian

Or an even cheaper solution for a Falcon - a Nemesis board. Among
other things, it'll speed up his system enough to utilize a workable
640x480 TrueColour screen, and even bigger when used with Videlity.
That's what I use when web-surfing with my Falcon, and I get
great-looking web pages with CAB 2.0a and STinG 1.08. And it's less
than 1/3 the cost of a $500 used Mac 040 :)

Hi Tony,

I appreciate all the enthusiasm my site seems to have generated.
I'm currently weak in the arcade area so its just beginning to evolve
and I'm just beginning to make connections with people in regards to
un-released and in-house Atari arcade projects, expect to see images and
information on prototype and unreleased arcade equipment from Atari in
the near future, I apologize that there isn't anything mysterious and
exciting in that section as of yet, I hope you liked the rest of the
site, take care and happy holidays.

> blitter speed (yes this also is multifunctional in a Falcon). Oh and either

Well, the blitter can't be used if you install Nemesis anyway, so there's not much to save there. And since NVDI doesn't even use the blitter in the first place, why not use it for the IDE? Almost DMA, and much faster than SCSI. Cheaper too.

SCSI will be faster than IDE only when you use MagiC and HD-Driver, and all SCSI-peripherals (scanners, streamers, ethernet-cards...) supports this mode.

With Linux OTOH it's quite another story...

funny, then why did I get this letter from Cedarnet (in response to
my original complaint)saying that they had issued you a warning (in
effect, a reprimand) regarding posting off-topic pro-Mac stuff in
comp.sys.atari.st? That agreed that what you were doing was against the
charter, was being willfully done as something to inflame the Atari
community, and referred to you as a "Mac Zealot?" The fact that you
hadn't used your CedarNet account to post here after that incident
obviously shows something DID happen - and your response here is just
another attempt of TIFKAS to rewrite history. Anyone who even does a
cursory search of comp.sys.atari.st through DejaNews can see for
themselves just what sort of posts you were doing here.

You have a history of disappearing and trying to dodge or change
the subject when the questions start getting uncomfortable - again,
easily proven via DejaNews. As for the clones, guess what? I DID mention that I was
wrong on the Umax question in comp.sys.atari.advocacy, and a subsequent
talk with my brother did turn up some other clone makers (albeit hi-end
ones), so I was obviously wrong with that as well. At least I certainly
admit to my mistakes. Why the attempted smear campaign, TIFKAS - did I
touch a raw nerve?:)
>
>> If you missed my last post, here it is reposted for you eludication:

according to DejaNews, you haven't posted anything in a long time
(save for a short message supporting Steve Jobs' "deal with the devil"
with Bill Gates in August that was simultaneously spammed on
comp.sys.mac). As a matter of fact, I'VE posted more messages in comp.sys.mac.advocacy
more often than you have in the last few months (yes, I read that
newsgroup, and I do posts there from time to time, albeit with more
courtesy and respect to Mac users than TIFKAS has ever done in the
Atari ones)

>I stated that if you were to walk into Best Buy that would be the case.
>There is a lot of Mac/Win hybrid software in the windows section.

According to my brother (also a Mac advocate and an official
Apple-trained service technician, albeit one who is
also very respecting of other platforms) such a statement may be true
only if the stater was very inventive with how the software is piled
(as with multiple copies, or top-to-bottom rather than back-to-front).
He also agrees with me that many of your claims are overstated and that
you are indeed in much need of a life - for instance, he's told me that
despite your claims to the contrary, there is no real speed difference
between an 060 Motorola and a PowerPC-based Mac that can label either
"too slow".

I should also point out that not everyone has access to such a
supposedly well-stocked store - the places I've checked out in Toronto are
Computer City, to which I was mostly impressed with their stock;
MacWarehouse; another Apple stalwart is located at Spadina and College,
which is slowly turning over to a PC store to survive. Although good
stores (with some excellent stuff hardware-wise - I bought an EZ-135
and my scanner from these stores), NONE have anywhere near the "12
30-foot piles" you're claiming. Toronto once had at least a hundred
good Mac dealers (including the biggest, Arkon); now they're down to at
least five, with Arkon gone, the place at Spadina and College turning
into a PC store with some Mac support to survive, and even MacWarehouse
slowly evolving to survive.

>
>> Just remember these things and keep asking them. Be sure to ask him
>> other embarassing questions as well should they crop up. :)
>>
>When will you admitt that you were wrong about the clones?

see above, TIFKAS. The fact that I was wrong about that now shows
that this matter is closed. Still open, though, is the many things you
have gotten wrong about Ataris that you still propogate in your
self-serving posts, including:

1) saying or implying that "Calamus is crap", when you admit you never even used the program (and please, even a cursory use of Dejanews shows you indeed did so).

2) claiming that Atarians have inadequate internet tools and non-existant web-tools (the fact that I am replying to you with a PPP connection within an excellent newsreader program shows just how "inadequate" the internet tools really are; the web tools I used (along with a good book on HTML) to construct the store's web site was done with my Falcon, HP Penguin and a text editor, so that shows up your little diatribe - not to mention the many sites now being done with HP Penguin.

3) claiming that Atarians rely on 80's applications (when stuff is still being developed both in shareware and, to a lessed extent, the commercial market).

4) that an 060-based Atari clone is "too expensive" and "too slow" to compete with a Power-PC (when according to a Mac expert there is no real difference in speed - and when a computer like the Hades/DirecT is made in smaller quantities than Macs to a more selective market sector, of course they'll be more expensive

>>
>> SAY YES TO APPLE. SAY YES TO ATARI. JUST SAY NO TO DISINFORMATION

>
>Speak for your self...
>
I do have a life, thank you. I play guitar. I have a job that, while not as prestigious or well-paying as a computer salesman, is one I enjoy in serving the public. I like going for long walks to explore. I've gone to England twice and enjoyed the countryside and the many sites in London (okay, so I did check out some Atari dealers and shows :)) I also specialize in researching urban legends and history. I am a voracious reader, mostly of fact, but recently have found the joys of Terry Pratchett. I like lots of different types of music. I often go out. look at the sky, and look in wonder at the miracle of this planet and of the day. I fret about my unmarried status, but all of us often wrestle with relationship problems from time to time. I like playing with all sorts of computers and PDAs, and like to drop in on used computer shops. I help my brother scout for old computer equipment for the museum he plans to open one day for school children. I went to see my 92-year-old grandmother with my family in Pennsylvania, and saw my other one and fixed a long-standing misunderstanding between us. Yes, I would call that having a life, and a good one at that.

I'm not perfect, but at least I have a good life - and I don't waste it by being a bitter misanthrope whose only goal in life is to try to be superior by trodding on the computer choices of others with campaigns of spam, flames, and hate-mail. With such tactics, TIFKAS, the only way you're going is down, without a net, and quickly - and there will be a lot of people in all the computer groups who will be applauding when

that happens. I certainly hope not for your sake.

Wow, great stuff! I was thinking of the cookies used by Atari
software and wasn't aware that there are cookies used by Web servers.
That's pretty cool.

Thanks for the info!

Well, I did try ATZ<CR>~~ and that didn't help. It would say "OK not
received from modem," or something to that effect. In the default,
it doesn't have a <CR> so I wasn't sure if you were supposed to add
one or not, so I tried it with and without. I even tried it with a
pipe character, as that's sometimes used. (FYI, I used Ctrl-M for my
<CR>.)

>Hmm .. I found the rates near enough identical to StiNG-PPP.

I guess it could be a lucky coincidence that I picked a very fast
time/connection, but it was flying during my test. My cps rates were
consistantly over 3000, and quite often over 4000. With STinG-PPP,
I'm usually around the 2800-3000 mark, sometimes going over 3000.

All in the Quick FAQ...

Format a 720K floppy on the PC. Move it over to the ST. Run 1st Word,
open te files, and save them on your PC floppy in text mode.

I really do suggest that you speak to Hallvard as he doesn't seem to
understand your bad feelings against him. He certainly has none against
you.

Hallvard is probably more supportive to the Atari community than many of
us ever will be. His web pages and list of FTP sites are probably some
of the most useful resources on the Net for Atari users, and his
contributions on this forum are always much appreciated.

Hey, he even supports Okami by maintaining a link to your page. I'm sure
more than half of people who get to your site are accessing it from
Hallvard's.

I really can't imagine him voluntarily making himself an annoyance to
anyone.

From: Curt Vendel <webmaster@atari.nu>
Message-ID: <348D7FCD.89DEBF3C@atari.nu>
Source record: 112207

Hi Roger,

Actually I'm a systems engineer so I have to work with everything
from Pentium workstations to fileserver to Hp9000's and DEC Alpha
systems, but I have always have my Atari 8-bits and a while back I sold
my Mega STe and I miss have a system so I figure its time to get myself
a TT030 or Falcon030 to play with.

Curt

I've got an Atari CX22 trackball that I bought for a C-64 several years ago that I would like to use with
my IBM compatible; it would be great for my kids to use rather than the difficult to grasp and
operate mouse.

Has anyone ever tried connecting the trackball to the PC serial port, and if so, are there any instructions or
drivers available to interface with it?

Please reply to me at adillon@icthomasson.com

Thanks for any and all help.

Phil Costantinou

3779. IDEal IDE drive thing

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: Phil Young <philyoung@myself.com>
Message-ID: <348D8C4A.2806@myself.com>
Source record: 112218

OK, sorry if this has been asked before, but I haven't seen it anywhere.

So does anyone have this IDEal interface from the upgrade shop?

I've been looking to get a hard drive and it seems to be one of my best options ATM (price and general use of the thing). I have a few questions about it if anyone can answer them for me (please!!)??

1. Is it easy to fit? I'm fairly competent with a soldiering iron, but I want to know if fitting it involves cutting stuff and soldiering onto chips etc.

2. What's it like to use? Is it reasonably quick at booting, access time, transfer rate etc. etc.

3. Do I need any other driver software to use it (i.e. HDriver 7) or can I use it as is?

4. Can I still boot from floppies once it's installed. e.g. to load games from disk which auto boot.

OK, I hope someone can help me with these questions.
If anyone can, then could you E-mail me with some info (aswell as posting it to the group) as I can't always get newgroup access.

Thanks

Phil.

>pump up your machine to 48MHz or buy an Afterburner.

My understanding is that the Falcon's SCSI is limited to less than
2MB/sec where as a good IDE on an Nemesis'd Falcon can get to around
4MB/sec. The quicker the buses the quicker the IDE, the SCSI doesn't
get quicker.

Rich.

If you run Okami in NOS mode it is possible to use Sting for both mail
and news. The online part is handled by Popwatch and Newswatch by Gary
Priest. Actually I'm using this combo right now. It works ok exept I
have to manually move BATCH.TXT so that Okami can find it. Newswatch
places this file in a separate ARTICLES folder (a la Oasis 1.35).
Okami insists on reading it from the NEWS folder.

3793. Gemulator 4.8

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: Richard Heldmann <heldmann@ix.netcom.com>
Message-ID: <66kov8$1f6@sjx-ixn8.ix.netcom.com>
Source record: 112232

Any comments on Gemulator 4.8 from Emulators, Inc.?
Does it run most ST software well? I sold my ST hardware a long time ago, and for reasons of nostaglia, I am considering purchasing it, in lieu of buying ST hardware. My computer desk is quite crowded already!

I'd like to hear both pros and cons....

Hi Jo! (still showing off your multitasking AfterBurner equipped Falcon to
your Amiga owning friends?) <grin> Seriously though, I hadn't heard that
when you install the Nemesis you lose the Falcon's Blitter chip-is that
right? I did know that you lost the FPU with the AfterBurner, though...

Thanks in advance for any info! ;)

>4MB/sec. The quicker the buses the quicker the IDE, the SCSI doesn't
>get quicker.

Hi Rich...I'm sure others with newer/bigger/faster IDE drives will do
better but with my ST9816AG, 2.5" 810 meg internal IDE I got these
results, using ICD's RATEHD.PRG:

Data Rate Average Access

Nemesis -OFF- 1265 kps 16ms
Nemesis -LO- 1754 kps 16ms
Nemesis -HI- 2080 kps 16ms

As anyone can see, (and like you said) it makes a not inconsiderable
difference! :)

You can view it only with browsers capable of Javascript. CAB probably loads
it fine, but I doubt that it would display it.

3799. Purchasing CAB

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <66i1tq$rh2@news2.tds.net>
Source record: 112251

I'm itching to purchase CAB 2.5, both for the feature that I'm aware of, and simply to support the effort. But I have some quick questions. I'm reasonably satisfied with my current setup, with the following exceptions (using CAB 1.5/2.0 Demo, CAB.OVL 1.2704, STiNG v1.08 with current modules):

1. Counters on pages only display when they have an explicit .GIF extension. This is not a serious matter, but still...
2. Reload, in numerous cases, does not seem to do a effective job, only reloading 1 or 2 items from a page.
3. In many cases, I am unable to access more than the first page of search results from a search engine. In addition, I generally can't perform an additional search/refine my search from the results page. I have to return to the main page to modify my search. This *has* improved, but it is still a problem.
4. My ISP (TDSNET http://www.tds.net or http://home.tds.net) has recently restructured their pages, and now they are totally useless. A lot of imagemaps, but none of the images display. Could someone with 2.5 visit the one of the URLs listed above and tell me whether it works for you? I've only tried 3 times, (I did remove the host from my cache each time, just in case) so maybe it's just a temporary glitch, I haven't actually looked at the source to see if they are doing anything unusual.

Comments?

Thanks,
Terry

Hmmm...I was wondering what was causing that. I assumed it was a
problem with those sites. I haven't noticed whether or not CAB 2.5
works any better. I'll pay more attention now, though.

>2. Reload, in numerous cases, does not seem to do a effective job, >
only reloading 1 or 2 items from a page.

I've never had this problem, unless it's a problem with the page in
the first place.

If you give me an example where this takes place, I'll see if it's
working in 2.5.

3805. Greetings, STing, CAB, Newsie, and STuff

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <66igqqgij1@newsbell.bellglobal.com>
Source record: 112257

Greetings to all in comp.sys.atari.st:

First off I would like to thank John Rojewski, and Hallvard
Tangerass for the help they have given me over the last month.
PS JOHN, I HOPE THERE IS TEXT WITH THIS POST ;-)

I am a reformed computer junkie who has just fallen off the wagon and
now re entering the computer addiction sydrome. I ran an Atari ST user
group from 1985-90 and by 1992, I had bailed out of computers all together.
Thus I am out to date on not just atari things but computer improvements in
General.

After a motorcycle racing accident in September, I decided to dig, the
Atari out of the closet and play around. Soon my nephew wanted to know if
the ST could get on the internet. Not being aware of the changes on the
net such as web browsers, I said , sure we can now that a provider has set up
locally. OF course when I said, yes, though I didn't know for sure.

My thanks go off to all those programmers who have created the
possibility for Atari's to surf the net. After being away from computers
for five years, it is nice to discover there is software for the atari and
actually users still around. IN FACT I AM AMAZED. I am still catching up
on software updates, (FIVE YEARS IS LONG) and I believe I am the only Atari
user within 60miles of me. And I don't personally know of Any Atari Users
left, that actually use them.

I did manage to get the internet software running
with no help whatsoever and now I would like you readers to fill in the
blanks. I would also like to comment on some of the posts
regarding STing, Cab, and Newsie.

My SYSTEM: 520ST TOS 1.0, 2.5 Meg of Ram, 20meg sh204 hd. 28800 modem
running at 19200, SM125, and an SLM804 for good measure.

1) Attempted to use 2400 baud modem and STIK, to connect.
Local provider PAP only. Bye STik. Dialed long distance.
STik worked.

2) STing.
a) While obviously needing xcontrol or cops, one of these programs
should be made available on the internet support pages. I had
friends with IBMs get me internet software, and of course after
they brought it I realized I needed a newer control panel.
There are many ST's not being used in a similar state as mine:-)
b) STing will not run without HS modem. I set STing modem to 2400
yet STing dialer will not load without HS modem. I believe this
should be mentioned in the STing documentation.

c) STing works fine IF: Since I use the PAP function of STing, I am
not certain about the bug everyone is talking about. It works fine
for me. I have STing 1.06 and dialer 1.10. So I am not certain about
updating, for the sake of fixing a problem I don't have:-).
STings PAP works for me in this order.
i)after loading in STing dialer, immediately go to port parameters
menu and change the ip. On my machine it constantly defaults the
test 127.0.0.1. You can place 0.0.0.0 or simply backspace and
leave blank. Then click accept. Now ENABLE modem.
ii)I don't use the find function. I simply send name, send password
and GET-IP.
This procedure allows me to maintain a connection everytime.
Placing 0.0.0.0. has not been as effective as leaving it blank.
Don't forget to fill in your PAP name and password too:-)

I have tried everything to have the 127.0.0.1 not show up. But it continues
to return. I have changed, cfg and scr, with no results. Also if you log
off and want to log back on, you must DISABLE the modem and clear out
the IP address that was sent you from your last loggon. Click accept and
do procedure again.

Now this is clumsy for me , but it works everytime for me using a dynamic ip
address. (1 month ago I didn't know what this stuff was). I know I haven't
explained it clearly, but I do know that others may be disconnected by there
Internet provider for the reasons I have encountered above.

Sadism:
Logged on with 2400 and floppy. It worked fine. (SLOW but fine).
Masochism:
Now I can communicate with other HAPPY alive and dying Atari Users:-)

Newsie .82

I used STeno with Newsie. When exiting Steno it would randomly crash
2bombs instead of returning to Newsie. This would create a file with a header
and no text. From then on I would send headers an no text. Until I found the
culprit file and deleted it.

I now use Tempest 11 and it works fine. I just have to remeber to save
as mailtest.txt or Newsie will create a mailxxx.txt file with only a header
and no text. Creates same problem as above.

If I hit the backspace button in Tempest, or accidently hit the Help
key. This will cause a four bomb crash, everytime. Reset computer and run
Newsie will result in 2bombs everytime. Newsie must try to load the file
newtest.txt, which is a zerobyte file because of the crash. Delete the file
corrupted zerobyte file and continue.

Since there is a pattern showing. I would believe that the person
having trouble getting newgroups or mail, has a corrupted xover.txt file.
And that this is not a direct problem of STing as he so believes. I can't
see the difference his change from Cslip to PPP would be for getting email.

I was having NUMEROUS program crashes when I started. And MANY HD crashes
as a result of missusing the programs. They are not user inept friendly.
Load Newsie, send mail, click edit. loads editor, change my mind, decide
not to send email, exit editor = CRASH 2bombs. Go back to corrupted file
scenario. Newsie will crash each time 2bombs, until mailtest.txt file
is deleted.

Ironically I can select post, newsie loads the editor, then change my mind
and decide not to post a message, exit the editor and newsie will not crash.
This is nice:-)

Now as I take advantage of Newsie features I really like it. And John was
a great help in feedback, to get me over the hump. Great Program.

CAB

OK this should be simple:
Internet Clients:

1)What is Gopher?
2)Is there a Gopher client for the ST?
3)What is WAIS?
4)Any clients I have tried will load, but crash upon exit.
2bombs.

External Viewers. What do you readers suggest for using as external viewers
I am not familiar with alot of the new extensions, and
programs that support them. Such as AU? I have tried
using some of my older programs as viewers, but after
they load, they crash upon exiting as well.

Proxy: What do I fill in here?
HTTP:
FTP:
ect.
I have filled in NNTP,SMTP, POP,

Ok, now knowing some of my GAPS in Knowledge.
Any mailer I have used within Cab will crash with 2bombs.
Any FTP program I have used will crash 2 bombs in Cab.
Thus if I want to FTP or Send mail, I must exit and use Newsie.

I don't believe Newsie is to be used in Cab under a Single TOS system.

CAB OTHER

Cache Edit. This program is designed for TOS 1.4, but many of the features
are usable with the older tos. I can remove and copy files. Exiting the
the program will definitely result in 2bombs and a pretty view of the desktop.
However it has never been fatal. So I do it after an online session. I like
it too much.

Cache FTP will not work with less than toss 1.4.

I believe this information should be in the documentation, but it isn't.
Thanks go to Manfred for his personal reply. So Unless others are successfully
using these programs with older tos (and want to tell me how), I would like
to see this information on the internet support sites.

STuff

I would like to here from other Users with TOS 1.0 or 1.2 and the above
listed software if there experience is similar to mine.

STing: If I think STing is causing corruption of files, and many times I do,
I just make STing inactive, from the CPX. This seems to be effective
for diagnosing problems, and while suspicious, I haven't been able to
prove that it has been the culprit of any of my HD crashes in the
last month. Sometimes when I boot, I get 2bombs. If I reboot
The drive will no longer exist. Nothing short of reformating the drive
will solve the problem.

Cab Supplement.
Correct me if I am wrong, but the Cache in Cab is subject to the 40
folder bug of early tos. I run folderxxx, set to 300, yet it doesn't
seem to matter. After a number of URLs, Cab becomes confused and sends
my HD into a constant loop (often), or a simple error message such as
a local host error E:/cache/b However, in the latter case I can
check the cache and see that the cache directory has no directories in
it. Reboot and Cache is there complete and intact. Another hint to
it possibly being the folder bug is the outta memory error that sometimes
occurs. Should the hard drive be looping (horrible sound) I must reboot
and all is well. More reason to suspect the folder bug. I can also
pretty much time when it is going to engage, based on the number of
places I have been and whether graphics are on or off.

Well this is a horribly long list. But I think it is better than a bunch of
short messages. I really am truly fascinated by the activity on the Atari
platform. What Till I start asking detailed questions on hardware and
software, I am following this newsgroup closely in order not to be too
FAquish. Also that prg file that came through, hmm, it was large, I must
have deleted it though when I couldn't read it. Could I have used it?

Lastly, that guy who bought the TT with 10 meg ram etc., I believe from
waterloo, for roughly $30. I HATE YOU:-). And I remeber using a TT in 1992
when they first came out. I don't remember them to be all that fast. Yet
it appears I could be wrong, I would be happy to here about falcons and TTs.

With all the problems with dealers mentioned on the net, I
wanted to mention a very positive experience. I ordered
HDDriver from Systems for Tomorrow on the 4th of December.
I received it today (8 December) by regular mail.
I can't ask for much more than that......

Actually, I don't know either. I am basing my statement at rather
cursory inspections of the cache, and w/out exhaustive study, it
appeared to be the case.

Well, OK (No! No more questions about the meaning of "OK" <grin>) -
Take AltaVista. It really doesn't matter what you search for, with
altavista there's likely to be multiple pages (well... maybe with the
exception of something like: Antarctica +aardvarks) - I'll receive the
first page fine. Then when I attempt to go to a different page, it
will actually receive the data, but not update. Just for information,
I *can* manually update by physically changing the size of my window,
which forces a redraw, (most of the time) - but that shouldn't be
necessary.

Thanks - I'll check again too. I could turn out to be due to the fact
that I'm using a 14400 modem, and it timed out.

The STE will not run in a 2.5 Meg setup. There are AUTO programs that
allow you to do it, but they only seem to work 50% of the time and
that's not reliable enough for me.

> Were the SIMMs too fast? Or what happened?

They can't be too fast. They just have to be faster than 120ns.

>
> I took the 1MB SIMMs out and left the original ones (2*256KB) there. Now

That's weird. Are you sure you put them in right locations. Try putting
in the 1Meg SIMMS on their own. When using 2 SIMMs, alway fill the slots
this way:
(Back)
A ============= <-+
B ============= +-- These 2 slots first
A ============= <-+
B =============
(Front)

I have tried 2.5MB before with 100ns SIMMs and it worked OK. I thouhgt
that 60ns SIMMs were too fast because STE crashed. I don't know...
Anyway, what kind of SIMMs should be used with an STE?

> Maybe you have physically damaged them, you did remember to discharge all
> static from your body first before installing them?

Everything is OK now... Nothing's damaged. The shield protecting
SIMMs and other stuff (I don't know what it's called) needs four screws.
It just had one and STE didn't boot. When it had all the four srews
suddenly it did boot. Weird...

I was bit too hasty with the original posting, but I was in panic. ;)

Thanks.

I just tried and it worked fine for me with 2.5. (Pretty nice Search Engine -- it was the first time I had tried it.)

If you're using MagiC, note that you can force a redraw with Alt-LS-Clr.

Any other questions about CAB 2.5, ask away. I'm liking it more and more every day as I get into more of its features.

I just got it from them, too, along with CAB 2.5. I've been dealing with them for several months now, and couldn't be happier. They are always very fast, helpful, and their prices are competitive. And they're all of those things in email, too, which is nice. That's usually how I order, in fact.

3815. HERE'S YOUR CAPABLE WEBBROWSER ;-)

Newsgroup: comp.sys.atari.st
Date: 1997-12-09 00:00:00 UTC
From: Werner Domroese <werner.domroese@pba.nl>
Message-ID: <66j640$bni@news3.euro.net>
Source record: 112267

Dear Paul,
First of all let me remind you that a Falcon030 is NOT a high-end computer.
High-end Atari's were Microboxes, TT's, TT/X's (if they exist) and ATW's.
And ofcourse, recent clones like Milan, Eagle, Medusa etc.

The F030 was supposed to be the first of a family of computers - the lower
end of this family that is. Take a look at www.atari.nu ...

As for a capable webbrowser... try Webspace.... Oh and - for high-end
graphics
you need a graphics card. Try the Supernova for your Falcon and hook-up a
SCSI-2 harddisk if you want Speed. Not IDE ' cause it uses up your Falcons
blitter speed (yes this also is multifunctional in a Falcon). Oh and either
pump
up your machine to 48MHz or buy an Afterburner. All together it should cost
about the same
as a cheap PC. As for the audio part... mention just THREE PC audio cards
that
can MATCH the Falcon in terms of quality and features - then name their
PRICES please. Have you ever btw tried a Falcon-Eye digitizer? Compare that
to
the miroHARDWARE for PC's...

Look, every computer has its own advantages and disadvantages. The Falcon
was
introduced in 1992. The 68030 should be technically compared to an Intel
80386DX
CPU at 16 MHz. If you look at price, you're absolutely right. PC's are much
cheaper.
And they also grow old faster. MUCH faster.... you can still do a lot of
nifty stuff with your
mahcine - but PLEASE: use it for what it's designed to do.

Good luck...

3816. Deuteros help needed

Newsgroup: comp.sys.atari.st

I am going insane...

Any hints or tips on how I can possibly beat the methanoids in the atari ST game Deuteros would be gratefully accepted. I pulled my ST out of the loft and found this game (probably bought by my brother, he hasn't a clue either). What ever I do the methanoids always seem to be able to produce far to many drones for me to combat. Aaargh!.

Please could you help. I'm getting too old for late nights banging my head against a wall.

Thanks in advance.

Hmm, I bought a Quantum EMpire 1080s, and I use CBHD.
The problem with CAF is that it's got its own internal SCSI Driver which
is based upon AHDI 6.06 - which doesn't support SCSI Identification.

Greetings... Alex.

>What are the advantages of cookie support?

Depends on how a web server uses 'em. The idea is that the server can send
you specific bits of info that it wants remembered, so that it can maintain
a "session" for you. First you should note that HTTP is intended to be a
stateless protocol, i.e., the server doesn't remember anything about any of
the clients connecting to it; every request is ordinarily treated as fully
independent, coming out of the blue. For some purposes though, it's necessary
for the server to maintain the notion of a session, to remember who you are
and what things you've accessed. Cookies provide a way for the server to keep
track of session info. The server gives you a cookie, and then on subsequent
requests to that same server, you send back the cookie. This way the server
knows who you are and what you've done on the web site so far, etc.

Generally this allows servers that require logins to keep track of the fact
that you've logged in, etc. For servers that let you buy things, cookies are
a simple way of maintaining a "shopping cart" - every item that you select for
purchase goes into a cookie list. When it's time to check out and actually buy
the stuff, the client hands all the cookies back to the server, so it can tell
what you're buying...

The shopping example is pretty unrealistic, I know. It comes straight out of
the protocol spec, so I gave it. For the most part, sites that use cookies
also need an alternate way for tracking, since not all browsers support 'em.

> removing the symlink at the same time.
> e.g.
> Frename(0, D:/CACHE/a/cabovl.123, D:/CACHE/a/00001234.html)

I understand what you mean but I don't know what it's worth with actual versions of CAB. I don't know if CAB already does some data processing if the file is not yet entirely available, i.e. does it start to format a html page when the file is not yet on the local computer or does it start to decompress a gif image before all data is available. There are many problems which need I/O suspension which is not always easy to do..

Secondly I think it's time to finally change the interface to CAB. Just look what you suggested to do. I like your idea, it's making the best out of the CAB<->OVL interface but it's not really elegant...

Greetings

Daniel Schaller

%v1.08 with current modules):

I just went back to my copies of CAB 1.5 and 2.0 Demo to check this out,
using the current MiNTnet overlay. (v 1.84, which by the way, you can
retrieve from http://www.highlandsun.com/hyc/)

%1. Counters on pages only display when they have an explicit .GIF
% extension. This is not a serious matter, but still...
%2. Reload, in numerous cases, does not seem to do a effective job,
% only reloading 1 or 2 items from a page.

CAB 1.5 certainly has problem #2. Basically, if an item is already in
your cache, even hitting Reload won't force it to be downloaded again.
I used the cache tool to delete the counter image from my page, and
then reloaded it again. There was no problem displaying the counter.
CAB really doesn't rely on the filename extension, it uses the Content-type
HTTP header. It's the overlay's job to process these headers correctly
and tell CAB what the type of a particular file is.

%3. In many cases, I am unable to access more than the first page of
% search results from a search engine. In addition, I generally
% can't perform an additional search/refine my search from the
% results page. I have to return to the main page to modify my
% search. This *has* improved, but it is still a problem.

I've seen this problem before, but it seemed to be fixed in the 2.0 demo.
In 1.5 I couldn't even find the "next" buttons/links on Hotbot or Alta
Vista, they simply weren't there. Looking at the source I see that the
buttons on Hotbot are table entries inside a form, CAB 1.5 probably just
didn't know how to handle that. For the most part this problem is gone
in CAB 2.5. The only remaining problem is with string lengths; CAB can't
handle URLs longer than 255 characters. This usually makes complex searches
fail, because the entire search request grows enormous and CAB can only
remember part of it.

%4. My ISP (TDSNET http://www.tds.net or http://home.tds.net) has
% recently restructured their pages, and now they are totally
% useless. A lot of imagemaps, but none of the images display. Could
% someone with 2.5 visit the one of the URLs listed above and tell me
% whether it works for you? I've only tried 3 times, (I did remove

% the host from my cache each time, just in case) so maybe it's just
% a temporary glitch, I haven't actually looked at the source to see
% if they are doing anything unusual.

I went to these URLs using CAB 1.5. www.tds.net gives a boring screen
with an HTML Refresh tag, pointing to home.tds.net. Silly of them, they
should have used an HTTP 301 Redirect error code instead. As ISPs they
have a lot to learn about configuring a web server. Anyway, home.tds.net
loaded fine, images and all. Of course the spacing was way off...
Was there a specific sub-document on this site that failed to display?

I've had this before with other comms. programs, Terry. The modem is supposed to work out the DTE just by looking at what is coming in but sometimes it fails to do this.

Put in some pauses, CRs to give it time to suss it out, Something like:

AT~~ATZ<CR>

>The next thing I noticed was the speed. It seemed to be a lot faster
>in action. Not only were my cps rates higher than ever, but I had
>far fewer delays connecting to and resolving hosts. It really seemed

Hmm .. I found the rates near enough identical to StiNG-PPP.

I bet you won't be able to find one of the ready made. There are very
few connections to make though so you should find a Maplin's (or go
mail order). They have the 13-pin DIN and the SCART bits, a couple of
metres of screened lead and you are home and dry!

The nearest to Laplink is Ghostlink (PD). Works with a GEM
representation of the PC file structure. It's a bit slow over the
serial port but, for a one-off, you could tolerate it.

There is also a faster method using the parallel port - not sure of
the name but something like "PARC".

Your description of the copy protection of Dongeon Master is pretty
interesting indeed, and also takes me back a long time. However, were you
aware of the many checksums in the game ? They were placed in the most
unlikely places, and only crashed the game after playing for an hour or so,
so most people never really noticed.
As of today, I am not sure that a full deprotected version exists.

ST+ Fanzine needs worldwide Distributors,

We have Distribution in the UK and USA and are now seeking anyone from any other countries to take on the same task,

The deal?

Release date for ST+ Fanzine is the end of the first week of every month, Launch date is the 7th of February 1998,

You will be sent the whole Fanzine by email in Pagestream format, You then Print it out and distribute, You advertise the Fanzine and You charge whatever amount it takes you to distribute it on a none profit making basis,
Quality of printing? well we are using an Inkjet printer and then Photocopying each order, So long as you have a half decent printer you can make your own arrangements, you can print every issue or photocopy, It is entirely up to you the distributer,

We feel this system is the best for a monthly Fanzine, it ensures that no matter where you are in the world, you can get ST+ on the same release day rather than having to wait a week or two later...

Interested parties should first visit the web page for ST+Fanzine in my sig, then email me for details, Hey it's not my fanzine, just my job to spread it :)

Look, this is hardly a matter for public debate. Suffice it to say
that I have had extensive dealings with Mr. Tangeraas, and that this
led to a point where I was obliged to say: enough is enough.

But it's no big deal, is it? I haven't done him any harm. I'm not
flaming him. He's welcome to use my software, if he wants to. The only
thing is, he has to look elsewhere for support. I'll not have him
bother me again.

If you talk to them again, ask them to look into the Fast-RAM problem
as well. CAF can't play any sound from Fast-RAM as it allocates fixed
buffers in low memory.

If they can't or wont do it, ask them to release the sources so that we
can update it our selfs. :-)

I know the problem, but anyhow many atari users are having BIG problems
with buying software. I know a couple of people who got VERY upset when
CAB got commercial as it would force them to pay for Alex hard work and
couldn't use it for free anymore. I wonder how many registerd in the
first
place. They bought a PC as they could get all the software for free and
I guess that says it all. I do agree that ASH do have some strange
update
polocies but I guess they are forced to as not that many buys their (in
most cases) excellent software.

%Right now 28kbd is the best I can do. Does anybody have these updates
%available. (compliled please, I hardly know what I'm doing with KGMD mint
%as it is!!)

You don't need to update MiNT, you just need fast enough hardware and
HSMODEM. Both the TT and Falcon have serial ports that will run up to
115kbps easily. Other STs would need hardware mods.

%I would likr to run Mint-Cab with a Kflex 56 modem. Is that possible?
%I would also need help in setting up a pppd chat-script that would connect
%via PAP (rather than the logon process I'm using now). Any help will be
%appreciated! Thanks

I'm using a K56 modem right now. Works great, with serial port set to
115.2kbps on my TT.

> from T-Online :(That's their fault - not your's.

Have you tried the DIAL.SCR for T-Online that some german user posted a while
ago ? You also just need to enter your phone number, password and port to be
used, and off you go. I plan to include that file into the next release.

Cheers Peter

> business. But I don't *have* to like it, or agree with it!

ASH are basically two persons, both being active in the german Mausnet. From
the way they talk I'd conclude they sell PPP-Connect for two reasons. First
they wanna make that extra money (fair enough). Second they did not choose
STinG or MiNTnet because they felt they could not control the authors. They
want a lot of control on what get's implemented, how it get's implemented,
and maybe they even feared Kay or I would stop supporting our packages. I
don't like that notion very much, but who am I to judge. Even worse, I got
the impression (and I downright dislike that a lot) that it's by their in-
stigation that PPP-Connect has it's own proprietary API and that the pro-
gramming docs still aren't available. It's just an impression and I might be
wrong. I somehow feel they do not intent to release programming docs, to keep
this corner of the market unpenetrable, so that by expansion they can create
their little monopoly.

However I'm confident the STiK / STinG community succeeds in preventing the
latter.

Why do you quote Magnus's message in it's entire length, without adding anything, and then the whole thing twice ?? Do you realize people pay money for you duplicating existing text ? This is considered anything but polite ! If you got something to say, say it, if you got nothing to say, leave it. Just saying "I agree" by duplicating the text twice is stupid nonsense.

Cheers Peter

PS.: Do not attempt to tell it's been a mistake. You can do it once by mistake, not twice.

And for people like me, who have replaced their .netscape/cookies by a link
to /dev/null. I tend to agree to the often cited notion of cookies being a
potential security hole. But many people want or even need cookies, so it's
good to have the option to use them.

STinG will run without HSMODEM if your TOS is V2.0 or later. I believe this
is in the docs, but I'm not sure. I know, lots of further work needs to go
into the docs.

> c) STing works fine IF: Since I use the PAP function of STing, I am
> not certain about the bug everyone is talking about. It works fine
> for me. I have STing 1.06 and dialer 1.10. So I am not certain about
> updating, for the sake of fixing a problem I don't have:-).

V1.06 is rather ancient meanwhile. You're lucky you got it working with your
ISP, as it's PPP contains quite a few bugs, at least one of them really bad.
So it does make sense to get a newer version. Nobody says that you should throw
away the V1.06 before you thoroughly tested the latest ;-)

> i)after loading in STing dialer, immediately go to port parameters
> menu and change the ip. On my machine it constantly defaults the
> test 127.0.0.1. You can place 0.0.0.0 or simply backspace and

You can save the changed settings, or you can load DIAL.SCR into an ASCII
editor and do the change there. I recommend the latter, as the file also
contains quite a bit of useful explanations.

> ii)I don't use the find function. I simply send name, send password
> and GET-IP.

Whooh ! That doesn't work with many ISPs.

> I have tried everything to have the 127.0.0.1 not show up. But it continues

> off and want to log back on, you must DISABLE the modem and clear out
> the IP address that was sent you from your last loggon. Click accept and
> do procedure again.

Some of these problems will disappear with a newer STinG. The others are
configuration related (see DIAL.SCR).

Did anyone get any docs to CAB 2.5's advertising filter? It's not even mentioned in the manual, and there was no readme explaining its use.

I'm not having much luck with it. I can't seem to get it to work, unless I specify a specific file, which is not practical. And when it does work with the default setup, I'm not always sure WHY.

Hi all,

I was just playing around with Wensuite 2.31a and when I sent a testmail
to myself I noticed there was too much action!
Some news were sent at the same time although I did not intend to answer
any of them!! Don't know why this happend yet, just want to let you know.
(I got a failure message from the server but they appeared in the group anyway!!)

Looks like a promising program but still have lots of glitches.
Documentation sucks! Mayor!!

Greetings, janne

I've managed a 829Kb DD (83x10x2) and a 1649Kb HD (83x20x2) with no
problems whatsoever. I've thought about trying higher, ie. 1815Kb (83x22x2),
but I'm a bit nervous about dataloss.

I have a similar 'problem' connecting to Demons news server. I don't know
which version of STiNG you're using, but mine is v1.08. I didn't have any
delay when using v1.06, but now it seems that before it resolves the servers
address, it spends an inordinate length of time searching the DNS cache.
After upto 30 seconds, it either resolves and connects, or connects. After
that, everything runs nice and smoothly.

I was using STiK for the above sp I didn't expect to get any further
than I did. I'll have to try STiNG's pap.

Sorry being a bit late responding. The PC blew up!!

Hi!

>Proxy: What do I fill in here?
>HTTP:

When you attempt to access a web site your end sends the site name to
the DNS server (NAMESERVER) which looks up the unique dotted decimal
address which is the site proper, sending it back to you. Once your
end gets this, it tries to connect to the web site. There may be an
awful lot of intermediate stages between you and the web site so it
can get slow.

A proxy attempts to do away with this. Rather than you connecting
directly, you connect to the proxy machine your ISP provides, so ask
them for its name. Perversely, it does the same thing but ends up
being faster because your ISP will be using connections with a lot
more bandwidth than a telephone line! Additionally, proxy servers save
copies of pages - if its got a valid copy then there's no need for it
to bother connecting to the site at all, it just sends its copy of it
back to you.

On the downside, proxys can get overloaded at peak times and end up
slower.

> will solve the problem.

First thing to check out here is you are not falling foul of the 40
folder bug. A program called FOLDRxxx.PRG can set aside more memory to
prevent it although check your hard disk driver does not contain a
similar option.

>Cab Supplement.
> Correct me if I am wrong, but the Cache in Cab is subject to the 40
> folder bug of early tos.

Bugger, I should have read one more sentence before I wrote the last
paragraph!!

> I run folderxxx, set to 300, yet it doesn't
> seem to matter.

Folder memory gets gobbled up a lot quicker than it would first
appear. Assuming the worst, a scan of all 26 folders in the cache
could take 27 of that 300 for a cache on a path of E:\CACHE\ (1 for
\cache\, 1 for \cache\a, 1 more for \cache\b etc).

If another process scans the cache before cab terminates, another 27
could go, and so on! The folder memory used by one process is not
available to another process - it has to be duplicated!

For the purposes of the 40 folder bug, a program is a process, an
accessory is a process, and an auto folder program is a process. Only
those processes which terminate *before* folder memory is exhausted
have their folder memory returned to the system. Accessories by their
nature never terminate so folder memory used by them is effectively
gone for good, same for auto programs which don't terminate (TSR's).

Once the bug strikes, no memory is returned ever again (only a reset
will work) and disk corruption can/will commence the moment *any*
process attempts to access a folder for which the system has not
already set aside folder memory.

> After a number of URLs, Cab becomes confused and sends

> pretty much time when it is going to engage, based on the number of
> places I have been and whether graphics are on or off.

I seriously recommend getting rid of tos 1.0 - its so buggy that its
almost impossible to program for. Another thing that worries me about
it is I have a vague recollection that the maximum path length is only
64 characters whereas it's at least 128 chars for other versions,
which if true, could be causing its own set of problems.

I dunno how true this is, but I've heard stories about some 2.5Mb upgrades being unstable.

Have a serious think about MagiC. With it, your tos roms are only used long enough to boot MagiC out of the auto folder whereupon it replaces everything in the roms with its own code. Not only will you get a reliable filing system but you'll get a pre-emptive multitasking Gem as well. Definately consider it if you can put 4Mb into your ram upgrade, in which case go for NVDI as well.

You might also try looking for a program like Marcel that can directly
import 1st Word files and convert them to RTF which may be more useful
when importing those files into a PC-based program. It's an extra
step, of course, but your formatting and attribs will be retained.
If that's worth anything to you...

After buying quite a few computers i've accumulated duplicates of

these items so their up for sale. I need the space!!! They goes
as follows:

Hardware: All with Manuals

* Golden Image Hand Scanner & Touch Up Software ..... $ 50
* Mega ST 2 ..... $275
* Atari 1040STf (1 Meg) ..... $ 65
* Color Monitor (Atari) .....$ 40
* Black & White Monitor ..... $ 25
* Atari SM804 w/Outburst..... $225
(Needs new drum and toner)

Hardware: No Manuals

* External Disk Drive ..... $ 25
* External disk Drive (Needs Power Adapter, Radio Shack) . $ 10
* Black and White Monitor ..... $ 35

Software: All With Manuals

* Easy Draw ..... $ 10
* Degas Elite ..... $ 10
* Typesetter St ..... $ 10
* Stalker/Telecommunication Software ..... $ 20
* G+Plus ..... $ 10
* Migraph OCR/Optical Character Recognition Software ..... $ 10
* Mr Boston Official Bartender's Guide ..... $ 2
* The Juggler ..... $ 5
* Geneva/(Multi Tasking Program) & NeoDesk(Desk Top Prg .. $ 50

Software/No Manuals:

* Hybrid Arts Ludwig Music software ..... $ 3

Games: All with Manuals

* F-15 Strike Eagle Flight Simulator ..... $ 10
* Elite/A Fantastic Voyage ..... $ 10
* Carrier Command/ Tactical Warfare ..... $ 10
* Defender Of The Crown/Knight Fight ..... $ 10
* Knightmare/Knight Fight ..... $ 10
* ShadowLands/Barbarian Fighting ..... $ 10
* Barbarian/Fighting ..... $ 10
* Lemmings/Maze and Building ..... $ 10
* Ultra V Warrior of Destiny/Knights ..... $ 10

* Baby Jo/Baby Super Hero ..... $ 10
* Drakkhen/Dragons ..... $ 10
* Gun Ship/Helicopter Fighter ..... $ 10
* The Pawn/Good and Evil Fight ..... $ 10
* Dragon Of Flame ..... $ 10
* Curse Of The Azure Bonds ..... $ 10
* Breach ..... $ 10
* Inside Brataccas ..... $ 10
* Star Fleet ..... $ 10
* Time Bandit ..... $ 10

* Romancing The Throne ..... $ 10

Games Disk only:

* Dragon Master ..... $ 5
* Rambo 3 ..... $ 5
* Lure Of The Temptess ..... $ 5

Programing Software & Book Combination:

* Mark Williams C Compiler/4 Disk/ and Update (2 Disk)
Mark Williams C For The Atari ..... $ 25

* CSD C Source Debugger1 Disk
Mark Williams CSD C Source Debugger For The Atari ST ..... $ 20

Programing Books:

* Prospero C, Language, AES Bining, Library, VDI Binding . $ 25
* Atari ST Internals/The Authoritative Insider guide ..... $ 10
* Atari ST Graphics & Sound/Mastering Capabilities ..... $ 10
* Peeks & Pokes/Hidden Secrets with in the Atari ..... $ 10
* Atari ST Application Programming ..... $ 10
* Atari ST Gem Programmer Reference ..... $ 10

Software Books with no Disks:

* Mark Williams resource Editor For The Atari ..... $ 3
1;2c
Willing to work on package prices. Buyer(s) pays postage!! All reasonable
offers will be considered!!!

>

I ordered mine one month ago now, along with a 65Mb 2.5" drive, and I'm
still waiting. You can try emailing dave@tusdev.demon.co.uk, but he
isn't very prompt to replying.

> I've been looking to get a hard drive and it seems to be one of my best
> options ATM (price and general use of the thing). I have a few
> questions about it if anyone can answer them for me (please!!)??
>
> 1. Is it easy to fit? I'm fairly competent with a soldiering iron, but
> I want to know if fitting it involves cutting stuff and soldiering onto
> chips etc.

First of all it's STE only. Apparently it's quite easy to fit as long as
your 68000 is socketed and not soldered. Installation involves removing
the CPU from te socket, and replacing it on the IDE board. I haven't
tried yet, but I was told it wasn't too difficult.

If fitted internally, you have to stick to a 2.5" drive for space and
PSU current reasons. Otherwise, you can move to a tower and fit any
3.5".

>
> 2. What's it like to use? Is it reasonably quick at booting, access
> time, transfer rate etc. etc.
>

Depends on the drive I suppose.

> 3. Do I need any other driver software to use it (i.e. HDriver 7) or can
> I use it as is?
>

It's shhipped withh AHDI, but dave told me it follows Atari's IDE spec,
so it's compatible with all driver software

> 4. Can I still boot from floppies once it's installed. e.g. to load
> games from disk which auto boot.

I am sure this one is in the FAQ but anyway. I don't know about any
transaltors, but you can save in 1st word as a plain txt file by
untagging a line in one of the menus (havent used 1st word for a long
time)... save to a disk formatted by a PC (to the format your atari
uses either singel or doubble sided 720 Kb probably..) and that s it.
Move your disk to PC and thats it. Ataris can read and write to
PC-disks (but if your tos is to old not the other way around)

Btw ... does .au in yur adresse mean you live in australia? I going

You need at least v1.2618 of CAB.OVL to work with the NT-based Web server.
Anything previous to that will cause missing graphics.

From: clab@buffnet.net
Message-ID: <66ltfbrjm1@buffnet2.buffnet.net>
Source record: 112157

I'm running Cab2.5 with KGMD Mint and everthing works fine. I would like to update the Mint Kernal and Mint-Net so that I can run a faster Modem. Right now 28kbd is the best I can do. Does anybody have these updates available. (compliled please, I hardly know what I'm doing with KGMD mint as it is!!)
I would likr to run Mint-Cab with a Kflex 56 modem. Is that possible?
I would also need help in setting up a pppd chat-script that would connect via PAP (rather than the logon process I'm using now). Any help will be appreciated! Thanks

No, one of them bought a 060/PPC-card...

> when you install the Nemesis you lose the Falcon's Blitter chip-is that
> right? I did know that you lost the FPU with the AfterBurner, though...

The blitter can't cope with the higher bus-speeds, so it has to be atleast
half-clocked which makes it pretty useless. In most cases it's just disabled.

You're wrong. I haven't put any NOS code in. I just expanded Okami to
import NOS's output and to export news and mail in such a way that it
can be used as input to NOS.

It doesn't cost much more to get a Nova card if you can find the
GFX card your self (a regular used PC card). The Nemesis wont even come
near a Nova card in terms of speed and resolution.

Hi Peter...I'm using Oasis v1.35 (Nos). Sorry if its not working correctly.
Since STing now works, I'm trying to switch over to STing only clients but
I'm not all there yet. I'm working on Newsie v82, which looks to be a great
program. Sorry again! :)

The Nova certainly looks nice. The only problem I have with it, is that I
would lose my 16 meg Ram card, and have to go back to 4 megs. (unless I
wanted to go with the AfterBurner) :)

Oh, yeah you are right. I forgot, I thought everyone had AB040s these
days. ;-)
On the other hand you will have more free ST-RAM with the Nova as well
as it has got its own screen memory.

It's pretty fast :-) But so far he doesn't have much software that use the PPC.

> >The blitter can't cope with the higher bus-speeds, so it has to be atleast

No, the OS use it's CPU-based routs instead. The only thing that can slow down/
crash is software that accesses the blitter directly, mostly games and demos.
The solution is to switch to 16MHz and fullclock the blitter. The Nemesis
switch-programs does this.

You could use the Magnum RAM-card with 4Mb RAM, which will give you a total
of 8Mb. You'll loose 6Mb, but the graphics-card is worth it :-)

>>Dan Ackerman has implemented cookie support in a beta version of his CAB.OVL
>>for STiK / STinG, and I'm confident he'll soon release it.

>What are the advantages of cookie support?

First you should note that HTTP is intended to be a stateless protocol,
i.e., the server doesn't remember anything about any of the clients
connecting to it; Cookies provide a way for the server to keep track
of session info. The server gives you a cookie, and then on subsequent
requests to that same server, you send back the cookie. This way the
server knows who you are and what you've done on the web site so far, etc.

However, there is sometimes "cookie abuse" on the Net. For instance,
try ANY page (including user pages) on http://www.pandore.qc.ca and
you'll find yourself bombarded with cookies that serve no purpose.

On the other hand, cookies CAN be usefull. WebCrawler uses them to
remember your search preferences (hits per page, search logics, etc.)
so that you can always have the search results formatted to your taste.

> Anyway, what kind of SIMMs should be used with an STE?

I am not sure, the SIMMs I got I ripped out of an old PC, 1mb SIMMs, and I tried them in the STe and they seemed to work and everything checked out so that was OK.

> Everything is OK now... Nothing's damaged. The shield protecting
> SIMMs and other stuff (I don't know what it's called) needs four screws.

The shield in my STe is missing, when I opened it up I was amazed at how little work I had to do as the slot was open for me.

Has anyone else had problems with Everest running under Magic PC?

If I try to run it from Thing by pressing f1 (I installed it under the tool menu) then I get a system destroyed message.

If its called as a result from clicking on a file to view then the system just locks up with no error message, the same if I just try to run the program.

This is with Thing 1.20, MagiC PC 1.01, Everest 3.6 latest beta

I have no familiarity with Signum, as my Word processor is Calligrapher
(I'm happy with it). I transfer files from Calligrapher to Word 6 using
export files as Rich Text Format (RTF). This transfers all WP control
codes, and little is lose. Can Signum save files in RTF format?

From: mike.borsley@zetnet.co.uk
Message-ID: <66msi6$r4a$1@irk.zetnet.co.uk>
Source record: 112178

Hi everybody,
I've been trying to install CBHD 5.02 on my hard drive
without success. I put it in C drive root position like the ICD driver
I want to replace but didn't have any joy. I also tried altering the
extension to SYS but still nothing happened.

It seems a comprehensive package, with a lot of German docs. I
don't understand. I guess it needs configuring, and would be obliged if
someone who uses this driver could give me some guidance.

Thanks
Mike

AKANTHOS schrieb am Montag in COMP/SYS/ATARI/ST :

A> Is N.AES better than MagiC?

I guess you can't say if it's better or not. It depends on what you want and what you personally like more.
N.AES is the best thing for people who worked with MultiTOS and liked it's UNIX-like task. It's faster and more comfortable than the old MultiTOS. There's a new version out in Germany, adding some more features to it that makes it even more comfortable.

MagiC is the right choice for everyone who wants a modern, secure and well-looking, very comfortable OS. It is updatet very regularly and has lots of satisfied users out there. And it's available in English (don't know what the case is with N.AES).

Another good choice seems to be GENEVA, the only OS I know you can get a demoversion. Just test it.

Grettings to Greece.

Greetings all;

Which seagate RLL drives will "bolt" into my Megafile 30 with no
modification necessary. I tried installing an st278R but apparently it
is a different type of RLL than the damned controller can handle.

I'd like to bump up to 60 - 80 mb.

I am using HDdriver 6

Thanks for the help!

Willard.

I have an STE with one meg of memory and was recently given two
1-meg SIMM's. I seem to recall that there is some way to install
these in my computer to achieve a total memory size of 2.5 megs.

Does anyone know which slots I should remove the 1/2 meg SIMM's
from in order to install the 1 meggers?

Are there any DIP switches to be set inside the STE when I do
this or anything else I should know about?

Thanks in advance for all replies,

Randy Kwak

Hi,

there are many out there who might know, but to all those who don't:

1. The Atari Falcon is a really great machine for browsing the Web.
2. I use CAB 2.5 and ASH's PPP-Connect daily and it works great, no problems with this team at all. ASH is going to release an updated version version of CAB this month with a FTP-client. You can also buy a new E-Mailer from them. Depending on the experience with all of their software so far, it will work fine, too.
3. I run 800x600 with 256 colors, also with no probs with CAB or anything.
4. PPP is available on the Atari. Use PPP-Connect and you'll have 0 problems. If you don't want to spend money (more and more people seem to have problems with that) use STinG. Download it from Peter Rottengatter's homepage. Lot's of people are very satisfied with this package. And yes, it supports PPP.
5. Don't believe so called informations that PPP isn't available on the Atari.
6. It's a shame to say that CAB isn't a good browser. It works fine, very stable and is very fast on a Falcon. Even on my MegaSTE the speed is ok. What's wrong with CAB. Remember. Versions <=1.5 are FREE! So who wants to blame the author? We should be glad that the Atari-market is so alive that there are enough possibilities out there for those who don't wnat to spend money (but who are at the same time willing to spend $500 for a Mac just to surf the Web).

Again: Don't be afraid to use your Falcon as an excellent internet-machine!

3901. two bombs mean....

Newsgroup: comp.sys.atari.st
Date: 1997-12-11 00:00:00 UTC
From: Frank Gregory <corvair2@bright.net>
Message-ID: <01bd0632$3a2b7560$137ad4cd@corvair2>
Source record: 112038

Pretty much says it all. I got two bombs over and over on a program I downloaded off the net (2in1 I think it's called) on my 520fm.
What's it mean????

This is wrong and may damage data. You must always use the driver's
installation software. Never install a driver by simply renaming it.

3909. Drivers for ATARI Graphics Card w/ SM194

Newsgroup: comp.sys.atari.st
Date: 1997-12-11 00:00:00 UTC
From: Wolfgang.Huetter@unibw-hamburg.de
Message-ID: <66pbfe$e1q$1@rzsun02.rrz.uni-hamburg.de>
Source record: 112046

Hi Folx!

I just realised that the empty socket on my "VIKING" graphics card is not for a graphics controller chip.

But to use the card and the attached SM194 with other programs than CALAMUS, I need a driver for it to display, for example, the desktop in full resolution.

Where can I get one? Is it PD/Shareware/Freeware?

Thanx in advance!
Wolfgang

3910. Megafile 44 Power Supply problem

Hi Folx!

I've got a Megafile 44 with a defective power supply.
What I need is a hint which component could be faulty, for I've heard that
Atari's power supplies have "special parts" that tend to be bad.

The type of the PS is: PHIHONG PSM-8012

Thanx in advance!
Wolfgang

3917. DA's Layout v6.1 Atari Now Available in English!

Newsgroup: comp.sys.atari.st
Date: 1997-12-11 00:00:00 UTC
From: chris@worldgate.com
Message-ID: <B0B5A12896689A061A@isdn-pool2-42.worldgate.com>
Source record: 112054

```
MAXIMUM LAYOUT
minimal outlay!
```

We are pleased to announce that DA's Layout v6.1 for Atari is here! This version is the anxiously awaited full commercial English language release and is ready for shipping NOW!

An integrated solution that incorporates powerful Page Layout tools, Type Setting tools, Bezier Vector Editing tools, Image Processing tools, Transformation tools and so much more, DA's Layout is all you need to create stunning advertisements, packaging artwork, business stationary etc. in black and white or full colour. Having your creations printed is a snap with our full support for the worldwide industry standard, genuine Adobe PostScript(R) Level 2 page description language.

DA's Layout supports PostScript Type 1, Calamus(R) CFN as well as Didot DFN font formats - you can even print documents that contain all of these font formats to any PostScript device!

Sharing artwork with other packages is a breeze as well! DA's Layout loads and saves any object, or a complete document in the Calamus CVG vector format, IMG vector format, DIG vector format and EPS as well as the worldwide industry standard bitmapped image format - TIFF. You can even view colour separations directly within DA's Layout! Have you ever gone to press and received results that were unsatisfactory? We have! Our Separation Preview feature eliminates these costly errors.

DA's Layout is filled with industry leading features such as; Multiple Page Sizes in a document, Document Wide Layers, 2 methods of Vertical Justification (leading grid as well as vertical justification with user definable offset), the ability to output film with objects on the same page that are assigned independant Chromatic and Achromatic Separation methods, Independant or Global Gradation settings, Object Level Trapping, Up to 12 Colour Separation Plates, Set Text on any Vector Path and so much more! You can even colourize bitmapped images!

DA's Layout Pro is expandible with Plug-In modules that enhance your creativity to the max! We have modules for Font Editing, Barcode Generation, Vector Auto Tracing, Adobe Illustrator level 3 file support, PostScript Clipping Paths, Archival Visual Database, 3D Extrusions with user definable light source, Monitor Calibration for printed ink simulation on-screen and Composition Merge Filters with user definable saturation, luminence and transparency settings. In addition we offer PhotoScreen, our FM Stochastic screening method up to 3600 dpi and the multi-award winning

Reference.K auto-K separation tables that ensure quality one step 4 colour separations - every time!
We have pre-bundled these modules in three superb packages that provide excellent value for the dollar!

DA's Layout can save your documents in many different ways. You can save and load any page, layer, object or a complete document. We even have a unique portable document format that embeds fonts and images for reliable cross platform with 100% compatibility! No need to send your fonts and images with your documents and leave lady luck in charge - simply save the file in our embedded format! This feature allows you to save a Layout document created on an Atari and open it on a Macintosh.

Download DA's Layout v6.1 now! Place your order for DA's Layout and get instant access to download your copy now from our web server! Naturally, we will still send your master disks and users manual in the mail. This new technology allows you to start using DA's Layout today.

See our web site for more information on the features found in DA's Layout Atari!
http://www.compdirect.com/digital-arts/atari
A demo is available for download!

```
Special Time Limited Competitive Upgrade Offer!
---------------------------------------------------------------------
```

Now, for a limited time, you can purchase DA's Layout v6.1 Atari for as low as $150.00 US! This special offer is open to any registered user of Calamus (Any Version), PageStream (Any Version), DA's Vector, DA's Vector Pro and Didot. The best part is that you get to keep your original program! All we need is proof of ownership of a qualifying product. You will receive a complete commercial package with a 200 page + reference manual professionally typeset and spiral bound, context sensitive on-line hypertext linked help files, master floppy install disks and a really nice - full colour - printed box.

Qualifying Competitive Products:
- Calamus, any version.
- PageStream, any version.
- DA's Vector, any version.
- DA's Vector Pro, any version.
- Didot, any version.

```
Competitive Upgrade Ordering Information:

You can order by phone, fax, snail mail or e-mail!

We require a photocopy or digital scan of your Qualifying Competitive
Product Master Disk clearly showing the serial number in order to process
these competitive upgrades. We also require your name, address, phone
number and method of payment information. We can accept Cheques or Money
Orders in US funds made payable to Computer Direct or credit cards (VISA /
MasterCard). Please do not send credit card information through e-mail as
it is not secure. For credit cards, we require the following, Card Number,
Expiration Date and the Cardholders Name EXACTLY as it appears on the card
along with your signature.

Shipping fees.
Continental USA $10.00 US.
Hawaii, Alaska etc. $15.00 US.
Canada $10.00 Cdn.
Canadian residents add 7% GST. Call us for current Canadian exchange rate.

Orders Only: 1-800-547-9203 M-F 9:00 a.m - 5.00 p.m.

SUBJ: New Atari WWW browser?

I found an interesting message about a new web browser for the Atari in a MAUS group - thought that people here might be interested in an English translation:

****
Written: 28 Nov 97 21:13:48
From: Robert_Schaffner@OF2.maus.de
To : All
Subj: Draconis Web Package
---------[MAUS.SYS.ATARI.INTERNET]--
One should simply take a look at the following WebPage: (will be in German I guess)

http://www.uni-bielefeld.de/atari/edracon.htm

This is the `Draconis Web Page'.

-----------------Snip--

Atari Browser/Mailer with own TCP/IP Stack.
PPP protocol driver. (SLIP/CSLIP should follow) All TOS computers from 1 Mb RAM up.
Modem freely configurable.
Central configuration of all required parameters for Browser, EMail.

-----------------Snap--

Take a look yourself for more. Unfortunately only just found it. Sorry.
****

Regards
/Peter/

Greetings...

I purchased a SoundPool ADAT interface to go with my Falcon and Korg 168rc digital mixer. I use CAF 2.06, HDDriver 5.10, ScreenBlaster 2, SoundPool's new FDI init, CAFfix, and that's it in the Auto folder. I have the old Steinberg FDI, upgraded with SoundPool's kit for 20bit capability.

The problem: When I'm recording to the ADAT interface of the Falcon, for some reason the outputs of the Falcon switch to use the wrong ADAT output channel. When I reboot, the outputs are always correct, but then as I record more tracks, an instrument that is assigned to, say, channel 3 playback on the Falcon's arrange page will move to channel 4, then 5, etc, randomly (in other words, a track assigned to the Falcon's audio track 3 will play back, and have volume in the mixermap controlled by, the wrong fader.. the one for track 4, for example)..

If I'm just playing back a session, the outputs seem to stay correct.. it seems to only happen when recording.

Does anyone know what the problem might be? Has anyone else had this problem?

Once I get this solved, my system will be perfect.. the combo of CAF, ADAT interface, and Korg mixer is killer for the Falcon user. So any help will be greatly appreciated.

3924. Sprites and Chip Music for Web and Desktop

Newsgroup: comp.sys.atari.st
Date: 1997-12-11 00:00:00 UTC
From: Eonic Man <eonicman@erols.com>
Message-ID: <34906C5A.DE6D5286@erols.com>
Source record: 112061

One of the things that I don't understand about modern computers is that none of them have a scriptable sprite engine available on the system as a global resource. If there were a sprite engine created for Atari, wouldn't it be possible to have fully animated "icons" on the desktop? Or perhaps Atari specific websites could send sprite and ST level chip music to further enhance the web experience. The jist of the work would be done on the user's machine. Perhaps to make it easier, a Media module could be developed for all ST and above machines that would add this level to their systems. I'm sure that ST Chip code and Sprite/PNG data is small enough to send over the net for sound effects and more. We could limit the Sprite color palette to 16 colors so that all Atari ST and above machine would be able to view it. Perhaps GEMscript could be used to access this "sprite/chip music engine" for the WEB or any other type of application. Who needs Java for multimedia if we could do this? We already have Python, even though we don't use it. Just an idea.
Any comments?

Peter Ross

Hi,

I just installed the Gemulator on my PC, and have a mountain of files to move. Unfortunately, I have

a big 350Meg drive on the ST which was formatted using ICD software, so the PC couldn't read it,
even if I had a SCSI card (Which I don't). I was hoping to move large segments of the drive with my
old TURTLE (v.217) backup utility, but it doesn't work right unless it's backing up whole partitions. The next best thing would be to just batch upload folders at 19.2 K baud, and let it
cook overnight. Ideally, a "Laplink" for the ST. Is there anything like this out there? Hopefully
PD? If not, a disk backup utility that can recurse sub directories, and doesn't crash all the time
would be the next best thing. Ideas?

I have an older version of GEMulator (getting the new one in the mail soon) and it runs quite well. Even STOS works with it! The only problems I've had are: It doesn't run any games & I can't seem to get Geneva & NeoDesk 4 to work. The games problem is due to the emulator not supporting them. I understand Geneva & NeoDesk work, I just can't figure out how. Ah well...

You may want to try out the demo that Emulators Inc. has, 4.6 I believe. You'll need a kind person to send you the ROMs though. I'm into games and all, but I still prefer GEMulator over PacifiST.

Greetings Atari users,

Recently I purchased Cab v.2.5 with PPP-Connect. And need to know if
PPP-Connect will work with Geneva?

I currently have Cab v.2.5 running with Sting and Geneva/NeoDesk. On a
PPP only ISP. And It works Great! However I would like to try PPP-
Connect with Cab v.2.5, if it will work with Geneva. So far I haven't
been able to get connected correctly with PPP-Connect. After dialing
the ISP, I get the following message....
Status Get IP Addresses
Command Service-Eintrage

Then everything seems to lock up. Any help is appreciated.
Send any reply postings to my e-mail address also.
BTW, I'm running a Falcon 030 14megs TOS 4.04.
CAB and STING are truly great programs.

E-Mail Address phantomm@eastky.net

>Is this another joke or what?

Hi Mille,

you can talk to Michael Schwingen, one of the Milan developers.
I'm sure he likes to know what you and others want implemented in TOS 6.
I'm also pretty sure he does not want to be overwelmed with mail asking him if
this is true or not. Just give him your straight wish what you want from TOS 6.

Michael_Schwingen@ac2.maus.de

Greetings, janne

BTW, congratulations to the "Atari Computing site of the month". I truly agree
with AC.

I have the same problem, both with v1.5 and v2.0(demo). I get the first page and data for further pages, but no update. And Altavista isn't the only one that causes this problem. I sometimes get it with Lycos and Yahoo. I've not tried resizing the window so I'll give it a go and see what happens.

> Is that how a 'reload' should work, with the cached timestamps being
> analyzed first?

I don't get a complete reload when I click 'reload', it seems to only go back for the HTML doc, loading the graphics (when I have them turned on) from the cache. And a shift-reload doesn't seem to be any different.

And the differences between v1.2618 and v1.2704 appear to be marginal. There seems to be a slight (perceived) increase in download speed. The other real difference appears to be when using a proxy cache. When I try accessing a page that has just been altered (often my own) with 1.26 I will get the page, if the proxy is on. With 1.27 I have to turn the proxy off or I receive a totally cryptic page that sends me to the servers home page.

One final thing that's interesting. Sometimes when there's a slight pause in the downloading, the status changes from '[?/? bytes]' to '[ ] 11 converting GIF'. This doesn't seem to be a problem with it since it only seems to happen while download GIFs. I'll pay a bit more attention and see if the same thing happens with JPEGs. If it does, I wonder if the .OVL is trying to have the picture download and decompress at the same time. It would be nice if it was :)

3943. TAF MIDI Night Dec. 17th, other news....

Newsgroup: comp.sys.atari.st
Date: 1997-12-11 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <348f6cd6.0@nemo.idirect.com>
Source record: 112120

Agenda for the December 17th TAF meeting:

We're going to be having a MIDI night! Yes, we're going to be demonstrating what has always been the ST's (and TT and Falcon) main advantage, it's standard MIDI ports, with two GREAT demos!

FIRST: Martin Neuland will be demonstrating the latest version of E-Magic's LOGIC program (2.5). Logic is a very popular program on the PC and Mac, and they were kind enough to finally release an update for Atarians, with new features similar to the Mac version. Martin will show all interested in the MIDI side just what this new version of Logic is capable of.

THEN: Dan Dreibelbis will be demonstrating Electronic Cow's MIDI ARPEGGIATOR! EC is an upstart company from the UK dedicated to finding new and wonderful ways to make music on your classic Atari STs; ARPEGGIATOR revives a popular function found on many vintage analogue synthesizers, and adds a few twists of its own - you can even export your creations as MIDI files. And it's handsomely designed too.

It's going to be a fun night for the holiday season - be sure to be there!

UPCOMING EVENTS FOR FUTURE MEETINGS:

JANUARY 21ST: INTERNET NIGHT! We'll be looking at CAB 2.5 and the rest of the STiK suite with the help of our special guest Martin-Eric Racine, a STiK expert who also beta-tests the latest from Dan Ackerman and Alexander Clauss. If you've ever wanted to get online with your Atari and have many or any questions on how to get started and set up, this is the night for you. Mark your calendars now!

FEBRUARY 18TH - GAMES NIGHT! - we're going to look at the best ways to have fun with your Atari computer, featuring some of the best new games available, including the demo for RUNNING, the new DOOM clone for the Falcon! If anyone has any requests for a particular game, be it new or classic, drop us a line and we'll see about covering it at the meeting.

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A

membership in TAF IS Atari support!

I may get over my head here. It is not the SCSI controller. It is the
way that Atari uses the DMA for transfer. The SCSI chip is the same
one in my Quadra. On that machine, transfer rate is about 4mb/sec.

Yea, that is one drawback. I ran mine on a 4 meg machine before
installing the A/B. Works fine, but you have to manage your memory
closely. An FX card might be had inexpensive now that it is
discontinued. AXIT too has a fast ram card for the Falcon that would
work nice with the NOVA. I think there are a few other makes as well.

I seem to have problems with Mint and HSMODEM 7. Whenever I'm logged into
my provider for an extended period, it starts sending out garbage (i.e.
my provider never replies to the data). I -never- see this when I don't
use HSMODEM. BTW, HW= MK-X Falcon w/Afterburner and Mega STe.

Originally, the STE supports 0.5, 1, 2 or 4 meg configurations. 2.5 will
work only if you install a small AUTO folder program (simmfix). The
problem with this setup is that it is very unstable. Sometimes it
reboots, sometime it doesn't, and sometimes it does correct the problem,
and sometimes it doesn't (causing bombs as soon as you use thhe extra
memory). It also won't work with game boot disks.

For all these reasons, I just took out the extra 0.5 megs, and it all
works fine.

>
> Does anyone know which slots I should remove the 1/2 meg SIMM's

The french ST Magazine stated that TOS 6 was being developed for the Milan, based on the old TOS 5 betas (4.92 I think). Apparently the Milan people have obtained the license.

I already tried to work without the ZIP-drive being connected, it does
not make any difference. Is there any program that can be used to
recover my harddisk. I start to get a little uneasy with this problem.
(I need the data on my harddisk, if there is any data left.)

Cecil.

> codes, and little is lose. Can Signum save files in RTF format?

Hi,
Signum II can't save in rtf. The best way we have found is:
1- save all images out of the file and convert them in a pc format
(gemview for example),
2- replace all "stranges" caracters (for example in french all letters
with accent) by a combinaison of caracters never used (I used | for ?,
|| for ?, ||| for ?, ...),
3- save the file in ascii format; you loose the format of the pages.
4- import your ascii file in word and replace the "stranges" caracters,
5- save your file.
Good luck.

No it don't!!! just try VI2.04 witch you can found on ftp.lip6.fr (yes
it's made by a french guy and i don't know if it's translated) it's a
better solution and it allow you to use greater resolutions than scb2
ones and it work well under magic.

Same here. STinG looks better and better for each release, and it's now almost as easy to set up as PPP-Connect. Just one question though; I see that some information is duplicated in default.cfg and dial.scr, but only the information in dial.scr gets updated when I change something within the dialer.

So I wondered if it's enough to configure everything in the dialer, or must I edit default.cfg as well? I have some problems with TCP (basically it drops two thirds of all packets), and I can't figure out what's wrong.

> without success. I put it in C drive root position like the ICD driver
> I want to replace but didn't have any joy. I also tried altering the
> extension to SYS but still nothing happened.

1. Copy CBHD.PRG on the root and rename it CBHD.SYS. (That's what you
did)
2. Launch the CBHDCONF application. There, it's a bit harder as it is in
german : all you need is in the last menu. First, you have to load
CBHD.SYS ("laden" if I remember) then use the "installiert" option. It
should go now. There's a lot of option you may try to configure, but
take care... I didn't change a bit.

> It seems a comprehensive package, with a lot of German docs. I
> don't understand. I guess it needs configuring, and would be obliged if
> someone who uses this driver could give me some guidance.

I hope the above helps you. I also use CBHD instead of the ICD '94. Note
that I don't know how to remove CBHD though. There are also other files
I don't know how to use (CBHD0, SCSI.RAM...). I just use CBHD and have
no problem on Falcon (some little problems of reading error while
booting with Magic 5.04 on STE).

Bye.

Not really true. If you want to use pppd with speeds above 38400, you'll need to either omit setting the speed in options.ttyX/.ppprc and set it with the SERIAL.CPX, or you must patch the kernel and pppd. I prefer the latter, as it allows all MiNT-aware software to use all speeds up to 250K.

The kernels and pppd are available at Draco's homepage,
http://www.orient.uw.edu.pl/~conradus/atarieng.html

Well I guess you're an expert.
Then tell me the difference between
Ultra wide SCSI 3 and Ultra DMA-IDE
(Yes I know the Falcon only supports SCSI-2 and Enh. IDE).
BTW - Doesn't SCSI-2 mean 20MBytes/sec?
And I mean, connecting a REAL SCSI-2 specific drive.
And yes, I use HDDriver. Who on earth still uses the old
Atari drivers? Eager for an answer :-)

3963. NULL modem solution - (Was "Re: Network ST to NT 4.0")

Newsgroup: comp.sys.atari.st
Date: 1997-12-12 00:00:00 UTC
From: Werner Domroese <werner.domroese@pba.nl>
Message-ID: <66r8pb$7s5@news3.euro.net>
Source record: 111990

Well, the nullmodem feature of WinNT or Win95 is called
Direct Cable Connection I believe, and needs to be installed
together with Dial-up networking. In order to do so,
you MUST connect your NT system at least once to
another NT or 95 machine using a cable, or else the
registry will not be modified and the machines won't see
the cable.

After this procedure, the null modem cables should
become visible and selectable within Device Manager
/ Resource Manager.

Hope this helps.

SCSI-1: 5MB/s
SCSI-2: 10MB/s
FastSCSI-2: 20MB/s
Wide-SCSI-2: 40MB/s
UltraWide Fast SCSI-3: 80MB/s
Fibre Channel: dunno

IDE: don't remember (1MB/s?)
Enh. IDE depends on PIO-mode 0-4 (on PC's at least: 5MB/s max)
- But is better on Falcons than on PC's because of the Blitters boost?
Ultra DMA (successor to Enh. IDE) 33MB/s. Requires late 1997
mainboard or a late 1997 dedicated PCI Ultra DMA-controller, and resources
by means of both addresses and interrupts. A PC only has about 15........
AFAIK, Ultra-DMA is not yet implemented in Atari environments.

But: IDE is cheaper because it needs the computers CPU or controller. At
least in PC's.
SCSI drives have their own intelligence and operate independant of the CPU.
On PC's IDE has DMA, SCSI does not. On Ataris it's the other way around.
Except that
a Falcon also has IDE DMA (other IDE solutions on other original Ataris with
IDE support
do not have DMA for the IDE - like the ST compatible portable stuff).
Or am I mistaken here?

SCSI on PC's: max. of 15 devices connected. On Atari: max. of 7
IDE: max. of 2 devices.

Please explain if you know more about this stuff.
If IDE is so good, then why do all the PRO systems come equipped with SCSI
rather than IDE?
I believe in SCSI.

3969. TADS questions

Newsgroup: comp.sys.atari.st

From: s970707@uia.ac.be
Message-ID: <EL2xCL.FBy@uia.ua.ac.be>
Source record: 111996

Hi everyone,
I have a few questions about TADS, the marvellous Text Adventure
Development System by Michael Roberts.

1) Are there any people on the Atari who are still writing adventures for it ?
2) I'm stuck in Shelby: The Light. I've tried every imaginable thing but I
still don't get anywhere. I have the anti-phase bracelet, found the key
to the garage and I suspect my next action has to be opening either the
large trunk or the Ante Chamber trapdoor.

Greetings,

It would work by using Magic Shadow Archive and manually selecting the boot sectors only. Sectors 1-9 I believe.

I've never done this though, so I could be wrong. I have saved a virus by deliberately infecting a newly formatted disk, then MSAing the infected disk. The resulting file only takes up a K or so.

> IDE: don't remember (1MB/s?)

It depends on the bus to which it is connected. On my Falcon my Quantum Fireball manages ~4Mb/s, although in the real world I guess it manages around 2-2.5Mb/s.

> But: IDE is cheaper because it needs the computers CPU or controller. At
> least in PC's.
> SCSI drives have their own intelligence and operate independant of the CPU.

Both IDE- and SCSI-drives are "intelligent", they both have their controllers "on board". SCSIs are a bit more sophisticated though.

> On PC's IDE has DMA, SCSI does not. On Ataris it's the other way around.

On newer PCs you have something called "bus-mastering", which isn't real DMA but close enough. I have never seen a SCSI-controller for the PC that doesn't have DMA.

> Except that
> a Falcon also has IDE DMA (other IDE solutions on other original Ataris with

The Falcon doesn't have IDE DMA. You can use the blitter to transfer data in the background, but the CPU is still heavily involved. The SCSI-controller OTOH works independently of the CPU and is a proper DMA-device.

> IDE support
> do not have DMA for the IDE - like the ST compatible portable stuff).

All other Atari's with IDE-interface (ST-Book, third party IDE-adapters) can use the blitter like the Falcon, provided that they have a blitter in the first place.

> SCSI on PC's: max. of 15 devices connected. On Atari: max. of 7

The SCSI-standard is 8 devices on the bus, the controller is one of them which means that you can connect upto 7 other devices. (I'm talking about SCSI/SCSI-2 here, I'm not sure about the newer standards).

> If IDE is so good, then why do all the PRO systems come equipped with SCSI
> rather than IDE?

IDE is cheaper, but for some applications (like direct-to-disk recording on the Falcon) or in environments that supports background DMA (Win95/NT, Linux...) SCSI is better suited. If you use TOS, MiNT or Geneva there's no point in buying expensive SCSI-drives if you don't explicitly needp it (D2D, many devices). MagiC supports background DMA if you have

HD-Driver and all other installed SCSI/ACSI-drivers supports it.

Werner Domroese <werner.domroese@pba.nl> wrote:

> Then tell me the difference between
> Ultra wide SCSI 3 and Ultra DMA-IDE

They're basically different implementations of similar concept. The
big difference is that SCSI is a general bus, while IDE is just
an interface to the PC-bus.

> (Yes I know the Falcon only supports SCSI-2 and Enh. IDE).

Enhanced IDE is an extension that allows four IDE-devices on
the same controller, the Falcon supports only two (the original
standard).

> BTW - Doesn't SCSI-2 mean 20MBytes/sec?

IIRC yes, but that's the upper limit on the *bus*. The Falcon's
SCSI-controller is just another device on the bus, and for some
reason (it's just too old and cheap I guess) it can't even reach
2Mb/s.

> And I mean, connecting a REAL SCSI-2 specific drive.

Doesn't matter what you connect, you'd have to look hard to find
SCSI-drives that's slower than 2Mb/s ;-) My old Mega ST manages
1.6Mb/s to a old Quantum EPS through an ancient ICD host-adapter.

>Direct Cable Connection I believe, and needs to be installed
>_together_ with Dial-up networking.

Unfortunatly, the Direct Cable Connection (DCC) only works for the parallel
port. You can use the serial port, with the Dial up Networking (DUN), but you
need a null modem file.

In order to do so,
>you MUST connect your NT system at least once to
>another NT or 95 machine using a cable, or else the
>registry will not be modified and the machines won't see
>the cable.

Can't confirm this, but it may be true for the DCC. For the serial port, you
can connect to anything that has a modem port & that can handle PPP & TCP/IP.

It should also be possible to connect to a machine running SAMBA, & use IPX
instead of TCP.

-> PD? If not, a disk backup utility that can recurse sub directories, and doesn't crash all the time
-> would be the next best thi.....

Well, I have an HP Coyote SCSI 1 gig drive and two small 100 meg IDE
drives for my Falcon. What I do to transfer entire partitions from one
drive to another is to use ST-ZIP and archieve the entire partition into
a single file and then transfer it then I unarchieve it when I'm done.
It takes almost forever (I take the opportunity to go shopping or
visit relatives while it does) but I very certain everything got
transfered that way.

Best of luck.

I had similar troubles trying to hook up a Quantum 1GB drive to an ICD Host. After e-mail conversations with Tom Harker at ICD, I learned that the old host adaptors made for SCSI I do not work with the latest drives, such as the Quantum SCSI III. Conversely, I have successfully daisy-chained an NEC CD ROM to the Supra and used it with ExtenDOS. So, it may work and it may not. You might e-mail Tom at www.icd.com to enquire about the buying the software drivers for the drive you want to buy and then ask if it will work with the Supra host. At worst he will tell you to buy a an ICD Link Pro, which may be better in the long run anyway.

Hey Atari Fans,

Does anyone know how it is possible to get new newsgroups created?

I'm suggesting a "comp.sys.atari.forsale" section, 'cos I'm sick of wading
through for/sale articles in these groups. I have nothing against them,
it's just that I think they should have their own group, so people who
aren't interested in them can ignore them.

Any ideas?

Thanks Robert. I took a quick peek and found the English site disabled, but took a quick scan through the German with my rudimentary college language skills. The text seemed to refer to a Sep 97 debut. Is this in production? It seemed to refer to being Falcon compatible. Is that right? It also quoted about 1,400 deutchmarks. Thanks only about $700 US isn't it?

Sure, what else.

> Second they did not choose STinG or MiNTnet

They couldn't choose STiNG, because STiNG was not available or anounced
at this time. And STiK had many problems and especially no PPP support.
This is why they can't use STiK.

But there was another TCP/IP stack in developement (called BLIP)
which was very promising. The author of BLIP has released some
software for MagiC (also a ASH product) so it was only naturally
that ASH choosed BLIP (which must be compatible to MagiC and not
only to MintNet or TOS).

> because they felt they could not control the authors. They
> want a lot of control on what get's implemented, how it get's implemented,

They don't control the CAB developement, and I don't think that they
want to control any other author.

> and maybe they even feared Kay or I would stop supporting our packages. I

Why?

> their little monopoly.

I think this is also wrong. The problem is, that the author of
PPP-Connect must write these docs for the PPP library. But this takes
some time, and maybe he doesn't have that much time (he's also writing
the Mail/News-Reader for PPP-Connect which is announced in the latest
ASH newsletter).

I don't know if it works with Geneva. PPP-Connect definitely needs
preemtive multitasking. Geneva alone offers only cooperative
multitasking. If you also install Mint, Geneva will also run
preemtive multitasking. So together with Mint it may work.
Without Mint it won't work.

On The MEGA/STE & TT030 Homepage, you'll find:

* General Info
- What are the MEGA/STE and TT030 specifications?
- TT-Ram settings to allow specific SIMM combinations.
- When to use SCSI termination on external devices.
- Links to obscure or foreign makers of TT products.
* Hardware Hacks
- Adapter cables for 3rd-party monitors.
- Modem-2 upgrade to allow up to 230k bauds.
* Repairs
- MEGA/STE and TT keyboards manufacturing defects
that eventually kill your Control key.

Thanks to Mario Becroft, Jo Even Skarstein and Frank Lockwood
for contributing some material for my page! ;-)

Well, I've had no problems with TDS, using SLIP, CSLIP or PPP. But
then, I don't need any authentication, so that took care of one
potential problem.

Thank you, everyone that replied. It was helpful.

3997. Sting and multitos??

Newsgroup: comp.sys.atari.st
Date: 1997-12-12 00:00:00 UTC
From: simon.walton@zetnet.co.uk
Message-ID: <66sgrq$1pv$1@irk.zetnet.co.uk>
Source record: 112024

Hi all,

Does sting work in a multitasking environment? I've got it set up fine for single tos but want to use some of the multitasking modules that come with CAB.

I've got multitos and mint working to provide pre-emptive mutitasking, but the dialer cannot find it's resource file on startup. If I load the dialer accessory after startup then I find that sting has not loaded properly from the auto folder. Do I need to setup something different to when using singletos? I'm using zcontrol by the way.

I'm not going to get MagiC or use PPPConnect as I don't agree with ASH's policy of bundling all their own stuff together for a big price, so I'm avoiding their products as much as possible ATM.

Cheers! Simon :-)

3998. FS: (2)1040ST systems - Free...

Newsgroup: comp.sys.atari.st

Source record: 112025

I have two 1040STF computers that I have not used for several years and would like to give them a new home. If you or someone you know can use the following items please let me know:

2 1040STF computers with mice. (one with a broken #4 key)
2 SC1224 monitors (one is a newer model and one is an older)
2 SH204 harddrives
1 External Floppy (Sorry I don't know the model number)
1 External CD-ROM drive (Sorry I don't know the model number)
Misc. software.

I would prefer not to throw out these machines. If you are will to either pick them up (SF Bay Area), or pay for the shipping then they are all yours.

Please respond via e-mail: dfichou@dyned.com

[CAB-Updates]
MK>Minor updates shuld be for free and major updates shouldn't cost an
MK>arm and a leg as they do now.

Hm. But think of the major problem Atari-related resellers have: there are only a few new customers who buy a new product after several months when the product was invented. From this point on the only way to save the support and the development is: upgrade prices.

In the shrinking Atari market this is the only way to get some money. It doesn't sound very nice, I know, but what is better: no more commercial software at all or upgrade charges?

BTW: Minor updates for small bugfixes etc. are always free of charge at ASH if you download them from the ASH-BBS.

Watch the modem send LED carefully. you can see when the resolver sends the
name query by a short flicker, and a short moment later usually the response
comes in, leading to a short flicker of the receive LED. This way to can check
if it's really the resolver wasting all that time.

> as easy to set up as PPP-Connect. Just one question though; I see that some
> information is duplicated in default.cfg and dial.scr, but only the information
> in dial.scr gets updated when I change something within the dialer.

Not sure which information you're talking about.

Note the different purpose of DEFAULT.CFG and DIAL.SCR. The former is there
to provide default values for the local network. They're loaded into memory,
and the LAN can work with them. The DIAL.SCR however is ISP specific. If you
dial up the connection to the ISP, the (internal copy of the) DEFAULT.CFG data
needs to be modified by the (what you called duplicate) data in DIAL.SCR.

Obvious example is the name server. If you run your own little LAN, you'll have
one machine set up as name server, and therefore the NAMESERVER in DEFAULT.CFG
will be that machine's address, so that the name service is available as soon
as the machine boots up. Later you'll want to connect to the Internet via the
ISP, obviously you need a different name server now. The Dialer thus will change
the internal value to the one in DIAL.SCR.

> So I wondered if it's enough to configure everything in the dialer, or must I
> edit default.cfg as well?

I guess you can answer this one by yourself now.

> I have some problems with TCP (basically it drops
> two thirds of all packets), and I can't figure out what's wrong.

Tell me how to reproduce this on my machines, and I'll happily try to fix it.
ATM I have no idea what to look for.

If you know how TCP works internally, you can even look yourself. Use Log-
STinG to log the datagrams, by turning logging on for set_dgram_ttl() and
check_dgram_ttl().

If you have another Atari, run STinG on that one too, and connect them via a
nullmodem cable. Does the problem prevail, if you try, for instance, an ftp
connection ?

Cheers Peter

Works fine with Geneva as long as as you place STinG after Geneva in
the auto folder.

When I've tried STinG with MiNT or Geneva/MiNT combination, MiNT always
reports a PRIVELEDGE VIOLATION when the STinG CPX's load. I've also
tried not loading the CPX's but when I run the dialer I get the same
results.

It would be nice to use STinG with pre-emptive mutitasking.

I can confirm that 2.5 just retrieves the HTML document. The other
day I had a corrupted graphic (it never finished downloading). I
tried to get it to re-fetch the graphic, but couldn't. I deleted the
link in the cache editor and freed up the cache RAM, but it still
kept loading the same corrupt graphic.

I usually use CAB 2.5 in Falcon high-color, but I've had no problem
using 2.0 with 256 colors in the past.

And yeah, speed in loading graphics is not CAB's strong suit, even
when it doesn't have to dither.

>
>I use CBHD driver. Somebody mentionned that soundpool recommended the
>use of the Atari HD Driver. How do I replace one by the other without
>reformating ?

Hello,
There's no problem - you just rename the existing SHDRIVER.SYS in the root directory to SHDRIVER.SYX or some other harmless name and copy the new driver there.
I believe SoundPool don't mean the original Atari driver, but their own modified driver, which you can find on their homepage,
http://ourworld.compuserve.com/homepages/soundpool/
For some strange reason, they recommend not to use HDDriver - they don't seem to like it even though everyone else does! ;)
If you want to use the old driver again, just delete the one you copied and rename the original back to SHDRIVER.SYS.
As long as you haven't used ICD's harddisk driver you should be able to exchange it without any problems.

(83x22x2),
>but I'm a bit nervous about dataloss.

Hi guys,
Just a small notice, since you're messing around with dangerous things... ;)
If ever your original diskdrives break down and you can't find another drive
that was made for Atari, you'll have to buy a standard PC-drive instead.
PC-drives often work a little different (don't ask me why) and in most
cases, I'm sorry to say that the special formatted disks won't be readable
in the new drive. Just consider this risk before placing vital things on
special-format disks.
To be absolutely sure about the functionality, keep to the 720/1.44 formats.

All,

I would like to hook up an external Syquest Drive(Infinity 40 Turbo by Peripheral Land)to a Supra 20(ser#21888339/Miniscribe 82309)which is running off my MegaST4. Hoping that I will be able to just daisy the syquest to the Supra, adjust the jumper settings and that the Supra controller will be able to support this drive. (I'm sure there is probably a catch right?)Any help or advice would be greatly appreciated.

Thanks,
Frank

-----BEGIN PGP SIGNED MESSAGE-----

Linux/m68k is the port of Linux, a UNIX-like operating system
distributed under the terms of the Free Software Foundation's GNU
General Public License, to computers using the Motorola 68020, 68030,
68040 and 68060 CPUs. Current releases support Amiga, Atari and
Motorola VME systems (MVME 147, 162, 166 and 167); porting efforts are
underway to the Apple Macintosh and various 680x0-based workstations
(at present, the HP 9000/300 series, HP/Apollo Domain series, NeXT and
Sun 3 series). Efforts to port Linux/m68k to other 680x0-based
systems are also encouraged.

The current, complete FAQ is available on the World Wide Web at:

http://www.clark.net/pub/lawrencc/linux/faq/faq.html (Master site)
http://ftp.uni-erlangen.de/pub/Linux/LOCAL/680x0/FAQ/faq.html
http://amiga.nvg.ntnu.no/linux/mirrors/lawrencc/faq/faq.html

Conversions of the FAQ into various formats (plain text, PostScript
and DVI) are available at:

ftp://ftp.clark.net/pub/lawrencc/linux/faq/
ftp://ftp.uni-erlangen.de/pub/Linux/LOCAL/680x0/FAQ/
ftp://tsx-11.mit.edu/pub/linux/680x0/FAQ/ (and all tsx-11 mirrors)

The plain text version of the FAQ can also be found at all Linux/m68k
FTP sites and mirrors as "FAQ" or "FAQ.gz" (compressed with GNU gzip).

More information about Linux is available on the Internet at
http://www.linux.org/; the Linux/m68k Home Page is at
http://www.clark.net/pub/lawrencc/linux/index.html

Questions and comments about this post or the FAQ may be directed to
me. General questions about Linux/m68k may be posted to the Usenet
newsgroups comp.os.linux.m68k and maus.os.linux68k.

'Til next time,

Chris Lawrence
Linux/m68k FAQ Maintainer

> 1. Counters on pages only display when they have an explicit .GIF
> extension. This is not a serious matter, but still...

The file "extension" shouldn't affect CAB directly, but it may have the result that the server sends out the data with the wrong "content type". Some other browsers will display the image anyhow, but this is really a problem with the site in question and not with CAB.

(Note: MSIE ignores completely the "content type" sent by the server and acts on the filename extension and/or the file contents. This is so contrary to the HTTP standard that they should be prosecuted for it. I think Netscape just applies a kind of "content type override" when it fetches an inline image and the server replies with a non-image content type; which is smart in a way, but it encourages sloppy work on the provider side, so other browsers have to reverse-engineer Netscape's error recovery.)

For me, clicking reload in the CAB 2 demo retrieves everything. CAB 1.5
retrieves just the HTML document. I tried all sorts of OVLs, too (not sure
if that makes any difference, though).

>And a shift-reload doesn't seem to be any different.

My mistake there... I guess that combination only works when offline
(ignoring what's cached in RAM and reloading everything locally).

I swear the CAB 2 demo used to do online reloads the same as 1.5. But I
jump around to and from both versions, so perhaps there lies my confusion.

Another trick that works for Netscape Navigator 3.x is to write-protect
the cookies file. So you can have the cookies you want (for example for
HotBot's search preferences), but never actually get any new ones.

The Communicator AFAIK has the option "do not accept any new cookies",
which serves the same purpose.

Ciao

Yes, it's annoying, but not only Ronald's articles are missing references
lines. Maybe it has something to do with

X-Newsreader: OASIS Daily Net (Atari) v1.35E

Or some people do not use the "followup" function provided by their
newsreader, but post a new one and quote manually ...

>Atari's power supplies have "special parts" that tend to be bad.

How faulty? No 5v, no 12v, fuse blown? It could be almost anything,
Wolfgang, and you will need a meter and patience to diagnose it.

The usual things to go are the high working-voltage capacitors
associated with the primary switcher circuit. These will often 'bleed'
onto the PCB as they age. BUT .... when they break they will often
take a number of other components with them - the main switching
transistor, the switch oscillator etc.

If the PSU failed because your HD had siezed-up the fault could be in
the low-voltage secondary circuit - rectifier, voltage-controller etc.

I see you are at uni. Can't you find a new electrical engineering
student who will sort this out as an 'exercise' :-)

The Atari handbook which came with the machine is no good at all (as
usual!!).

A general Atari reference (Profi, A-Z) will get you a long way but,
for hardware-specific info., you will probably need to trawl for FAQs.
Try M-E Racine at q-funk.

I use Audiotracker quite successfully with the Atari driver, though I did have problems with other hard disk drivers.This could be because the drive I was using was too slow.Soundpool reccommends IDE drives in their manual over SCSI and I believe they optimised their version of the Atari driver to suit IDE.

This happens to me but not all the time. I haven't figured out why yet.

Its probably a result of when CAF was upgraded to support the ADAT interface.
Steinberg said they and some problems when the added ADAT interface support.
At least thats what I recall I heard.

Yes it does. I've accessed Compuserve with it. Also whats neat is that
I could also run Stalker at the same time (to do a maunal log-in).

Without the MiNT kernal I was able to connect with Compuserve but CAB locked
up.

I did get a run time error at one point though but the system didn't crash
only CAB did.

Er... Looks like someone's been changing the directory structure around
without telling me. The incoming directory is only for uploads, but the
New directory is supposed to let you see newly indexed files. Currently New
is a symlink pointing to incoming, which is not the way things should be.
I'll look into it...

For another guy who had the same problem, the "fix" was switching off Van
Jacobson Header Compression. For quite a while now I've had reason to suspect
some bug in the VJHC code, even though many people seem to be happy with it.
So if you got VJHC enabled, you should certainly try to switch it off.

> I know only one being active in the Mausnet.

I've seen messages from both.

>> Second they did not choose STinG or MiNTnet
>
> They couldn't choose STiNG, because STiNG was not available or anounced

STinG is available since May '97. PPP-Connect was several months later.
You may claim that they could not choose it because it did not support
PPP at the time, but that's a different matter.

> at this time. And STiK had many problems and especially no PPP support.
> This is why they can't use STiK.

There was a bigger problem for ASH with both STiK and STinG. Dan and I
consider networking software too important to be sold as commercial soft-
ware (which seriously restricts distribution). In the case of Dan, there
was the additional problem of ASH being in another country with another
language. So neither of us had committed ourselves.

>> because they felt they could not control the authors. They
>> want a lot of control on what get's implemented, how it get's implemented,
>
> They don't control the CAB developement, and I don't think that they
> want to control any other author.

You had a wonderful idea initially when you created the CAB interface for
loading different CAB.OVLs, built specifically for various TCP/IP stacks.
This has served CAB greatly, by providing the basis for using all stacks
that are there, a very liberal way of thinking. Just great.

Now ASH sells CAB for you, but they won't do it without PPP-Connect. This
is just contrary to the whole point of the OVL idea. It's obvious that ASH
dictates here how CAB is gonna be sold. It's also faily obvious that you
do not control with which other packages CAB is bundled or not. To assume
that you do, would basically impute a rather twisted mind to you. I won't

go that far, especially as I know another programmer whose software is sold
by ASH and who has told me a few stories.

>> and maybe they even feared Kay or I would stop supporting our packages. I
>
> Why?

I was just speculating, note the 'maybe'. Apart from that, you won't call it
unusual nowadays if Atari programmers abandon their software, would you ?

>> stigation that PPP-Connect has it's own proprietary API and that the pro-
>> gramming docs still aren't available. It's just an impression and I might be

>> their little monopoly.
>
> I think this is also wrong.

Fair enough. Neither did I claim absolute truth for what I said. It's a feeling,
that just happens to drop well into a general picture of ASH's behaviour which
I gained in the last two years.

The STiK API is a well established one, it's been there for two years,
with many clients. Taking your attitude, one could even call the "PC"
hardware (the stuff with Intel CPUs running Windows) proprietary. The
PC hardware is not proprietary because it's well established, the same
held for the STiK API.

> PR>I somehow feel they do not intent to release programming docs, [...]

I'm merely expressing feelings, not claiming any more. That's the difference.
Apart from that, if I had known that Thomas Much is "one of ASH", I had hardly
said above that ASH is Oliver and Volker, had I.

Depends. The Megafile 30 and 60 are RLL drives, the Megafile 20 and 40
(very few exist of the former version) are MFM drives, like the SH 204
and SH 205.

> BTW - Doesn't SCSI-2 mean 20MBytes/sec?

No, SCSI 2 usually means "Fast"-SCSI, which is up to 10 MB/s.
You can gain 20 MB/s only by using either "Wide"-SCSI (doubling
the bus width) or "Ultra"-SCSI (doubling the clock frequency).
But the peripherial must of course be able to provide the data
fast enough, currently few real harddisks exceed the 10 MB/s
limit.

Ultra-SCSI is the same. Wide-SCSI in theory supports 16 devices (with
controller), but in reality this is not possible due to restrictions
on the maximum length of the bus and the minimum distance between two
devices.

Shit this is tight ;-) I suppose it's a half meg system, since the 520ST+
with one meg has never been delivered with the 360 floppy drives AFAIK.

> He tells me that the problem is file-transfers since his "provider" -as far
> as I understand it's a library which gives him free access through some
> sort of menu system on a UNIX machine, and they tell him that he needs
> "Kermit".

Kermit is supported by most recent terminal emulators, like CoNnect, or
Rufus. It's however not possible to run them together with the TOS image
in a half meg system. I remember the TOS image and the early ST basic
interpreter left 11 kB (!) for the basic program on a half meg system.

The only option is either upgrading to at least one meg, or putting in TOS
ROMs or EPROMs.

> -I've never formatted disks to 360Kb (single sided). Is this the same as
> setting i.e "Kobold" format DD (720Kb) disks, but with 1 side selected
> instead of two?

Precisely.

> -He tells me that he has to load TOS into memory first. I suppose this is
> an AUTO program -is this correct?

No. The machines has two 8k EPROMs containing "The Boot", which is a simple
bootloader. That one asks for a disk on reset and loads and starts the
TOS.IMG file on the system disk.

> -As for "Kermit"... I did find an ancient copy of it somewhere, but it's a
> standalone program, so apparently this won't work for him. He would need a

simon.walton@zetnet.co.uk (Simon Walton) writes:

> Does sting work in a multitasking environment? I've got it set up
> fine for single tos but want to use some of the multitasking modules
> that come with CAB.

I've written STinG with multitasking in mind, it works very well with all
known versions of TOS and clones. Note MultiTOS has never been finished by
Atari, so I do not consider that one a usable OS.

STinG works under single-TOS, under MiNT with any extended AES (NAES, Geneva,
XaAES), under MagiC old or recent versions, even under the emulators MagiCMac
(Apple MacIntosh) and MagiC-PC (Intel hardware (!)).

> I've got multitos and mint working to provide pre-emptive mutitasking,
> but the dialer cannot find it's resource file on startup. If I load
> the dialer accessory after startup then I find that sting has not
> loaded properly from the auto folder. Do I need to setup something
> different to when using singletos? I'm using zcontrol by the way.

People have got it sort of working with MultiTOS, but since MultiTOS itself
is far from being stable, no application can be under it.

> I'm not going to get MagiC or use PPPConnect as I don't agree with
> ASH's policy of bundling all their own stuff together for a big price,
> so I'm avoiding their products as much as possible ATM.

I agree with your disagreement with ASH's policy, but MagiC is just magic
on your machine. Even if you do not want it, you can use Geneva or NAES
with MiNT, which is a beautiful alternative to (the piece of crap IMHO)
MultiTOS.

Source record: 111905

Hi there!

I use Videl Inside to create custom modes, and often I run into a very annoying problem. A lot of times when I try to create interlaced modes, and nearly every time I try to make a true color mode, the window buttons in that mode become half-width. This isn't so much a problem as much as my Speedo fonts become double-height also. This makes nearly any program which uses Speedo fonts hard to use in these modes, since the fonts overlap. Is there any way to tell the computer to stop doing this? It is very frustrating! Thanks!

Mike Freeman

: with 16 colors. I am using a falcon w/14 meg and the browser is not
: what I would call a speeder. What is your experience using this setup?

I have used most all of the incarnations of CAB on my Falcon (a 4 megger) and never had trouble with 256 colors. I also find it to be quite speedy, considering I'm running at 16 MHz with a 14.4 Kbaud modem.

I must say, each version of CAB and the CAB OVL seem to speed things up a bit, with 2.5 being somehow quite a bit faster, in feel anyway, then version 2.0. I have not attempted tomeasure or document this perceived speed increase though.

In any event, don't expect your 16 MHz machine to be able to lay out the page as fast as some modern 200 MHz beast. And don't expect a slow modem to be able to keep pace with a 10baseT or something.

4053. How to use cabmint.ovl 1.84

Newsgroup: comp.sys.atari.st
Date: 1997-12-13 00:00:00 UTC
From: Martin.Byttebier@ping.be
Message-ID: <881973956_OASIS_@ping.be>
Source record: 111939

He,

Can someone explain me how to use cab-for-mint.overlay 1.84?
I give it a try but with no success so far. I always get a "file not found" error. It seems that the ovl isn't corresponding with the modem.
I'm doing this on a Hades 060 running MiNT1.12 (patched for the Hades), MiNTnet 1.0 PL 1 beta, N_AES v1.1.0, Thing 1.20 and HSMODA7 (Hades version). I also make use of Gluestik v0.02b5
My MiNT/MiNTnet setup is based on the TAF-package. I only added the latest stuff.

With the STik.ovl I don't have troubles.

```
GP>I simply stated that PPP-Connect clients won't be free because ASH
GP>aren't releasing programming docs.

Where do you know from? ASH *will* release the docs to the public after the
E-Mailer is finished. Sven (programmer of PPP-Connect and the E-Mailer) has
no time to do it earlier. If you're interested then just ask Sven for the
docs and you'll get them.
```

PR>ASH are basically two persons, both being active in the german Mausnet.

Eeeeenk. Wrong answer. :-) You mean Oliver and Volker? But there are some others.

PR>that it's by their in- stigation that PPP-Connect has it's own
PR>proprietary API

It's as proprietary than the STiK-API, no more, no less.

PR>I somehow feel they do not intent to release programming docs, [...]
PR>so that by expansion they can create their little monopoly.

Tsss. In maus.sys.atari.talk you wrote several weeks ago to Thomas Much that he's not fair when writing about other products, because he's "one of ASH". Now you write here some feelings that aren't fair, too.

If you're interested in the docs you can get a beta version from the author.

Hi Simon,

Well, I've never been able to get STinG to work using MultiTOS/MiNTv1.14.5
Peter is aware of this, but feels MultiTOS is to buggy to work with. I
understand his reservations, but my setup works well with many other prg's.

Actually, I'm not sure MultiTOS is the problem. I get AES(v4.10) errors when
using STinG with single TOS 4.92. So maybe AESv4.10 is the problem. I'm
not an expert here by any means.

> I'm not going to get MagiC or use PPPConnect as I don't agree with

Hi there! A little more than a year ago I finally broke down and built myself a Windows 95 PC. This left me with a BUNCH of Atari ST stuff that needs a home. I've sold most of my hardware but the software is still taking up closet space that my wife wants. I'm looking to sell or trade as much of it as possible soon. I've also got a few PC pieces (modem, printer, sound card) left over from upgrades that I'd like to get rid of as well.

Check out:

> setting i.e "Kobold" format DD (720Kb) disks, but with 1 side selected
> instead of two?
Go to your standard desktop, something very common in TOS 1.0>1.6
and select format. Then choose SINGLE. That's all he's looking for
nothing complicated.
>-He tells me that he has to load TOS into memory first. I suppose this is
> an AUTO program -is this correct?
TOS boots from disk, and leaves him with roughly 260k. I am looking at
my old TOS systems disk now which I had kept for historical reasons. I open
it and look.....ah... uh, gee I don't remember doing that. Well its a
ChessMaster 2000 backup disk now. So much for history, at least the label is
still on it:-)
>-As for "Kermit"... I did find an ancient copy of it somewhere, but it's a
>standalone program, so apparently this won't work for him. He would need a
>terminal emulator (he tells me that the library can handle VT-100,
>VT-220 etc. so a standard VT-100 emulator will do)... with Kermit built in,

4060. 520st+ and floppy drive. not working.

Newsgroup: comp.sys.atari.st
Date: 1997-12-13 00:00:00 UTC
From: gjdz@zeelandnet.nl
Message-ID: <349245f2.1085236@news.zeelandnet.nl>
Source record: 111946

Recently somebody gave me his old atari stuff.
A 520st+ and 2 sh204 harddrives.

I would like to save the programs on the HD's to floppy's.
But I can get the floppy drive working on the 520.

If I connect the FD to the 520 it's reading the disk I think, if I
double click the A drive it's reading the disk but there nothing on
the disk ? the atari says there nothing on the disk,but I'm sure there
is, if I check the disk in my Megaste the disk is working perfect.
And I am using 720kb disks
Writing to the FD is also impossible, if I try to make a folder the
atari reply's drive not found?

I'v also tried to connect the sh204 to the Megaste with a buildin 40mb
HD but I can't get it working ?

I probably have to format the sh204 because the drive letters conflict
with the one's on the HD in my megaste, but is there a way to backup
the HD first ?

Anyone has any advise ?

Thanks in advance.

Peace.

Right, that looks like the latest release..

>production? It seemed to refer to being Falcon compatible. Is that right?
>It also quoted about 1,400 deutchmarks. Thanks only about $700 US isn't

I don't no in witch status is the 'milan'
I'm not intressed in some 'milan' adventures.
I can wait for the finishd machine. (If it comes in that direction)

But the price looks like ok.It's around 1500 'deutschmarks' :-))
(Simple wrot: DM) ;-)
Watch out for some 'special' extensions you'e need to get a
'complete' machine with SCSI, Midi, Romport features!!

(That in my opinion is the expensiv part..!)

>Falcon on the IDE cable? I don't wish to do anything until I at least
>have an Idea that this might be true.

If you have the right adaptor.. :)
It's possible to use a second device in 2.5" or 3.5"

The first device must be jumpered as `master' the second as 'slave'
Use a external psu to connect a second 3.5" IDE-Device!
(Watch for the 4 free pins right side of the 2.5" IDE-Connector)

2.5" IDE-Connector

```
############################## o o
############################## o o
^ ^
Master Slave
o o
#
o o
Close Open
```

Do not connect ANY IDE-Device in the wrong way to your falcon!
(It's an easy point to destroy the hole machine)

Take some tips out of DOITF030 V 5.9

>With the STik.ovl I don't have troubles.

Are you using the STiK.ovl with the STiK driver, or with GlueSTiK?

Do you have other MiNTnet clients (like telnet or ftp) that *are* working?
More to the point, do you have pppd running, and a working ppp link?
Remember that the MiNTnet OVL doesn't talk to the modem at all, it talks
to MiNTnet and MiNTnet talks to the modem via a serial line IP driver.
If pppd isn't active to maintain your ppp session, then you get nowhere.
The file not found error is my best attempt at matching the "host not found"
result from a failed hostname lookup to a standard TOS error code. (In
hindsight, I probably should not have mapped these error codes at all.
It obscures problems just as much as having no error message...)

I suppose the most important feature for a next release would be a
decent doc file instead of the readme.hyc that I've been updating. Sigh...

What's wrong with saving as ASCII and loading that into almost ANY Word
Processor?
That's what I do anyway, that way I can take my work to college and home.

I have a program somewhere that converts 1st word plus to RTF or the other
way round, can't remember exactly.

>it will not work under Geneva.

No, it isn't. I had it working under N.AES/MiNT. With Geneva however
you need to run MiNT on top of it. I've tried it several times with
Geneva/MiNT but so far no luck. The problem is that the special
cab.ovl seems not to react with Cab 2.5. Why? Don't now.
BTW: With N.AES I've exact the same problem now. As I've a good
working MiNT/MiNTnet setup I don't use it at all so since the first
day I got it working and now lies quite some time. In the mean while I
forgot how I did it but believe me it works definitely with N.AES.

Hoi,

STing <does> work with a multitasking setup. I've it working under
N.AES/MiNTnp/Thing1.20. As N.AES uses AES 4.10 I don't believe it's due
to AES 4.10 that it won't work on your machine.

I also have it working with Geneva (without MiNT) so it definitely
doesn't need a pre-emptive multitasking OS in order to work either.

Make sure STing is loaded as last program so after MiNT or in the
case of Geneva after the HSMODA7 drivers.

Hope this help

The following is for sale, I am looking for £800 o.n.o.

If postage and packing is required, we will have to come
to some arrangement, but I am willing to deliver or meet
halfway within a reasonable distance (from Coventry)

Atari Falcon

Tower case with external (Mega STe) keyboard
14Mb RAM
PowerUp 2 accelerator (32 Mhz)
ScreenBlaster (screen resolution expander)
Double Speed CD Rom
65 Mb IDE Hard Drive
170 Mb SCSI Hard Drive
High Density (1.44 Mb) Floppy Drive
68882 FPU
14" SVGA Colour Monitor (with adaptor)

Included Software:

Magic 5
NVDI 4
Ease v3
DA's Picture
Apex Media

An ideal Xmas present? ;-))

They're great. For just basic typing of text, I'd prefer the Portfolio keyboard to any of the WinCE machines I've seen. Just about any DOS application that doesn't do fancy custom display things and is compatible with the real IBM-PC will run on it. I used to use Word Perfect 4.1/Word Perfect Executive on mine. QEdit also works well for just a text editor.

There's a huge amount of freeware and shareware (and hardware upgrades) around for it, including some excellent programming languages. I switched to an Apple Newton MessagePad some time back, but I still keep the Portfolio around as a backup.

Try doing a Net search. Last I looked (last year) there was still a very active user group on the Web in Europe, but I don't remember the URL.

As for worth -- new ones I've seen advertised were going for $150. That's been probably a year ago.

One caution: they were made ultra compact by making all the standard I/O ports external modules (miniaturization wasn't as advanced when they were made). You need to have the external printer and serial modules to make much use of the computer.

Ira Adams

****
I don't do .INI, .BAT, .CFG, or .SYS files. I don't assign apps to files. I don't configure peripherals or networks before using them. I don't manage IRQs and DMA channels, either. My computer works for me & not the other way around. I have a Macintosh.

Hi !

I am looking at bringing my own stone to the Atari Falcon Audio world.
My project is to convert a Falcon in a GM sound module, with 16bits
samples & the works. This way all of you who have moved to PC or MAC can

have a very good excuse to keep the falcon in your home studio.

Anyway, I am in dire need of any information regarding Falcon Audio
Programming & DSP interfacing. I am also desperately looking for PURE C.

Thanks a million,

Steph

1997 08:03:33 GMT that you wrote:

>Hey Atari Fans,
>
>Does anyone know how it is possible to get new newsgroups created?
>
>I'm suggesting a "comp.sys.atari.forsale" section, 'cos I'm sick of wading

well if your sick of wading fru them then you must have seen a lot of
them.. and if you have been seeing them for that long then surely you
saw the last thread on this subject and maybe even the thread before
and theres been plenty of threads on the subject..

The truth is that a proper newsgroup is very hard to start.. AND you
need the support of the atari community to start it because it goes to
a vote.. you cant simply decide to have one.. there may be a lot of
people who prefer the sales to be in here, what about upsetting them
by changing the whole atari newsgroup hiarachy because you dont like
it?

Saying that.. the vote would probably be to split the newsgroup.. but
it will never happen.. its been tried...

the alt hiarachy is the easiest to start a group.. but not all news
servers take alt.. so you would be cutting off a lot of atarians from
even having the option of viewing them,

Hope that explains a little for you <smile>
.

That will work, of course, but you'll lose all your text formatting.
No italics or bolding or underlining, etc. If the destination program
recognizes RTF files, then the formatting survives the trip through
the transporter (so to speak.)

hmmm, this might be common knowledge, but at the same time, I'm sure
I'm not the only one that didn't know about it:

After talking the other day about forcing CAB 1.5 to redraw a window by
using the Fuller, I decided to try a few different things. One thing
I have discovered is that I can now see the maps that display at
various sights, for example, Yahoo. It works best if your window is
already full, so that CAB doesn't actually reload the page, just
redisplays it.

Methinks '95 doesn't actually run on a PC but in some "ethereal Nth dimensional plane", the PC only being an intermittent link between its reality and our own. I say this 'cos '95 wasn't running at the time the PC did a belly-flop. Nooo, it were NT wot was running it were.

Just to clarify and really labour the point. You have 2 operating systems, both of which must be shutdown before cutting the power. One of them isn't running and one of them is. The one that *isn't* running is called '95 and the other which *is* running is called NT. So ...

Q: Which OS should be screwed up?
A: '95 of course!

At least you know where you are with the 40 folder bug! :-))

Frankly, I'm amazed at the amount of html some of the web construction programs on the PC can come up with, much of it useless. No surprise there eh? iirc nested tables are time consuming to process.

Did the page have a large blank bit extending forever at the bottom of the page per chance?

That's a "bus error" which invariably means whatever piece of code was
being executed at the time shouldn't be doing so. A typical example
might be asking for more memory then not bothering to check if you
actually got it before making use of it.

> What's it mean????

Something is going wrong! ;-)

I can't recall what 2in1 does offhand but check the docs to make sure
it isn't conflicting with other programs and also make sure the
program was not corrupted whilst being downloaded.

I don't think so. I seem to recall Tos was loaded somewhat (but not
exactly) like a game in that information is written into the
bootsector telling the rom osloader such intricate details as the load
address & other low level stuff etc, and tos itself is stored as a
sector by sector image rather than a file.

Thanks for the information. I'm doing a lot of interesting things with
my Falcom and need a lot of extra space for Windows 3.11 and the like.
(Not to mention CAB and Pagestream).

James
Boise, Idaho

P.S. I thought it might be interesting to others who follow the newsgroups to show where I'm living so I started to list my town after my name. I received some private E-Mail asking me that.

Hi,

Anybody here using a flatbet scanner on their falcon? Just asking
to see if there are any particular model I should be looking at.

Thanx.

4103. Atari ST4 disc files to PC

Newsgroup: comp.sys.atari.st
Date: 1997-12-13 00:00:00 UTC
From: Nicholas R Mason <nmason@access.ch>
Message-ID: <3491C74E.25367648@access.ch>
Source record: 112037

Hi,

Can anyone tell me if there is a means of getting a file produced on an ST4 GEM system to a PC. The 3.5 floppies (the only hardware!) are NOT the same format as PC disks. They certainly cannot be read on Windows NT4. Nor can a HD floppy be read on an ST4 machine.

What are the options?

TIA

Nick Mason, nmason@access.ch

Hi Jan!

Just notified that TOS 6 will support long filenames and use of the right
mousebutton on icons to get a popupmenu.
Background disk fileoperations (Ref to latest issue of ST Computer).
Yihaaa!

This is really something.
Now the next logical step is, which processor will Milan use? 68060? and
will the machine support Ethernet network?
Maybe you and I should take a ferry to Kiel next summer and return with two
Milan060. Think I can scramble some
DM in that time.

Mille

Date: 1997-12-14 00:00:00 UTC
From: Mille Babic <mille@tripnet.se>
Message-ID: <670moleea1@minox.tripnet.se>
Source record: 111840

Gary Priest skrev i meddelandet
<69826608_000003_OASIS_NEWS@the-gap.demon.co.uk>...

:I *don't* agree with ASH's idea of PPP-Connect. STinG is *better*, works,
:and has more clients, and the programming docs are *freely* available.
:ASH is trying to corner a market, and you can't blame them for that, it's
:business. But I don't *have* to like it, or agree with it!

That's true, and it seems that PPP-Connect and the supported apps is here to stay. The development of these apps will sertainly increase. Fiffi the FTP-client and ASH Mailer is already released and works properly with CAB.

Think that we will se more of this type of discussions here, but it will be sad to read hard discussions similar to them Netscape vs IE had the past years. Its good for the development of Atari Internet apps in general, but but.

:I personally feel that the average Atari user is going to stick with STinG
:for tcp/ip than ASH's (or any other newcomers) stack.

STinG is one of the absolutely best piece of handmade apps that we have for our computers. The Ethernet support and API is stunning. Its nice that people like Peter is here with us and not on the other side (PC).
But, experience from "the other side" shows that it isn't the best that sells or uses in common. What people (not enthusiast like us), want is a complete package ready to use, ASH can nearly deliver these solutions.

Maybe its the right time for someone to pack a Internet package like www140.zip again? Maybe only with the excisting Internet clients so that people can choose STiK or STinG as a add-on.

:What really pisses me off though, is (like you say above), the *expensive*
:upgrades. I bought CAB2.5 (am currently running CAB2.7 beta). If I want to
:upgrade my *official* 2.5, then it's going to cost. A lot of money!
:HD Driver is a similar thing. I had 6.00, but the upgrade to 7.02 cost me
15
:quid. I saw very little benefit from it though. I just always like to be
:running the latest version. 15 quid still seems a bit steep to me.

Yes, I have passed this stage and nearly forgot this expensive upgrade. Just received CAB v2.6 upgrade, this time it was cheaper. And I still use the AHDI driver, its just as you says, its expensive. I have hold the HD Driver package in my hand three times, in Kiel and at a Atari Show and every time: Why is good software so expensive. Just bought MagiC and what

is MagiC without the HD-driver? Why can't the HD-Driver be a optional extension to MagiC instead. My pocket is empty too.

I think what STinG really needs (to make it more user-friendly) is a
GUI for the configs. I know the dialer lets you edit the DIAL.SCR,
but one GUI for all files would definitely make it a lot easier for
newbies, as well as less intimidating. The thing that's so nice
about PPP-Connect is that it's so easy to set up, and that's because
of the really nice and easy-to-use GUI. (Of course, as a fairly
expensive commercial program, it SHOULD be all that.)

Yes. Normally when mail or a news article is sent, there is some time
passed before you are returned to the application. You can watch the
curser as kind of a counter.

When a message is not sent, as soon as you send the message, you are returned
directly to the application (NEWSie). I have found that Antmail will send mail
at the time when NEWSie is having problems with one of my providers
(Windows NT server). I can send mail through my Unix server without
problem with both applications.

With V0.80 of NEWSie, I would get a recepient error from the NT
server. With V0.82, that error is no longer returned, but another
saying the there is no period at the end of the text. Looking through
the log file does indeed show that the proper address is present and
the file was sent with a period (control "d" for Unix?).

Anyway, I cannot send mail through the NT server with NEWSie V0.82 but
can with Antmail (abit difficult to post to newsgroups with Antmail
however:).

The NT server has had many problems getting his server working
properly, especially his newsserver, so it has been hard to tell if
the problem is on my end or his, except to send mail and request a
status of the server at the times I had problems.

One more item, I can use NEWSie to send mail direct to the NT provider, but mail send to an outside address is not delivered. I was using another SMTP servers ID in the configuration and that did work from the NT server (until the other provider caught on and stopped that "undocumented" feature:).

Hi John,

I do save the edited message. At first I thought the problem might be related to Everest for some reason (what I use for the editor). I tried using Devpac as an editor, as well as a few others with the same results. The "mailtest.txt" files are complete when I go back to review them.

As I said earlier, the problem does not come up often, and that is what makes me think that it is "server" related as opposed to being a problem with NEWSie.

Mike

4115. Is there a VFATCONF CPX available?

Newsgroup: comp.sys.atari.st
Date: 1997-12-14 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <26815473_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 111849

Does anyone know if there is a CPX version of the VFATCONF program that comes with MagiC? It seems to me, that it's the kind of simple job suited to a CPX. I want to be able to easily turn on/off long file names, on my ZIP disk partition, and a CPX would be the tidiest way to do it!

If there isn't, does anyone know, how to program the above switching? I could write the CPX, but don't know the relevant MagiC calls etc. for doing the above!

Cheers,
Gary

If you want, I can email you the contents. The disk doesn't really
contain much - just a program called 'ST-Tour' (which might be useful
- it shows how to use the mouse and windows etc) and a game called
'Ranarama' (which isn't that great IMHO).

4119. Ultimate Virus Killer 2000 - SPECIAL OFFER!

Newsgroup: comp.sys.atari.st
Date: 1997-12-14 00:00:00 UTC
From: karies@wxs.nl
Message-ID: <34954270.3242784@news.wxs.nl>
Source record: 111853

Good day to you all, Atari friends!

I am releasing a definitive version of my "Ultimate Virus Killer", now called "Ultimate Virus Killer 2000", version 8.0. Now is your chance to get your hands on the definitive piece of virus killing software for the Atari ST/TT/Falcon range of computers. Here's what it can do...

1) It can kill more viruses than any other virus killer...right now over 100!
2) It is the only virus killer that can recognise "UVD Virus", "Carpe Diem Virus" and "Pharaohs Curse Virus"
3) For the past two years or so it's been the only virus killer that's still updated, and it will continue to be updated at least twice per year
4) It works on any ST/TT/Falcon system with 1 Mb of memory (or more)
5) It supports any multi-tasking OS that exists
6) It also runs on GEMulator and PacifiST on the PC

This piece of software can now be yours for the amazing price of US$ 10 (or 5 British pounds, or 15 German marks, or 15 Dutch guilders) - and that includes postage! And the special offer is that, if you send off your order before 1 january 1998, you will get the next update (to be released around summer 1998) COMPLETELY FOR FREE (sorry for my shouting :-).

So don't think twice and get the definitive virus killing tool for the Atari range of computers, the "Ultimate Virus Killer 2000" version 8.0, right this minute.

If you need more info, email to me at karies@wxs.nl.

The address to order at is Richard Karsmakers, P.O. Box 67, NL-3500 AB, Utrecht, The Netherlands.

Of course, while I'm at it, I would like to use this message to wish all of you the best Christmas you've ever had, with a cool 1998 to follow!

J> what I would call a speeder. What is your experience using this setup?

I'm using the German version of CAB 2.5 on my Falcon with 12MB.
It works fine with 16 and 256 colors, no problems till now.
You could be right: other projects like WenSuite (Adamis is only in a Beta-
stage, same with WenSuite) seem to be faster than CAB.
I had some probs with the demo of 2.0 on a MegaSTE. The 2.5-version runs fine
on both, F030 and MSTE.

BEN schrieb am Freitag in COMP/SYS/ATARI/ST :

B> I think that PPP-Connect is a Magic only application and so
B> it will not work under Geneva.

That's not right, sorry.
PPP-Connect should run on every pre-emptive Multitasking-OS, which includes
MultiTOS/MinT
Geneva/Mint.
Note that you need MinT, when you're using Geneva!!! Geneva on itself just
isn't pre-emptive!!!

I must admit I heard of problems when people try to use PPP-Connect on another
OS than MagiC. I don't know how many succeeded with a MinT-System ...

They plan to start selling the new Milan in the first quarter of '97.
The first prototypes were shown in September/October.
I don't know if they had a running system at the Atari-Show in Paris.

J> production? It seemed to refer to being Falcon compatible. Is that right?

Nope, the Milan-team are planning a DSP-card (could be compared to the one for
the Hades). But the earliest release for that is somewhere in '98 AFAIK.
There's a French project for a Falcon-compatible machine. I don't know how far
they are, sorry :(

J> It also quoted about 1,400 deutchmarks. Thanks only about $700 US isn't
J> it?

The planned price is about DM 1500.--, that's under $1000, you're right.

From: godbey@wizard.net
Message-ID: <671r19$99q$1@news2.cais.com>
Source record: 111863

This question has been posted before, but since I haven't seen an answer I thought I'd give it another try:

Stik works well for me with cab, newsie, etc, with Geneva and Neodesk. Sting will work, but only in a single tasking mode. If I use Geneva and Neodesk neither cab nor newsie works. Cab rsolves the host, but doesn't load anything. Newsie will open the list of newsgroups, and tell me how many messages are in each group, but when I try to get the list of postings to a particular group it goes into never never land I have to reboot.

Does anyone have sting working with Geneva/neodesk? If so, did you use any special settings?

John

4130. Neodesk/Geneva Questions

Message-ID: <882123878_OASIS_@pcc-uky.campus.mci.net>
Source record: 111864

I finally upgraded to a multitasking setup and I've got a few questions.

I'm using the Neodesk 4/Geneva combo, and so far, I like it. Here are my questions:

1) When you form a program group, how do you rename the program icons with long filenames? The manual says you can do this, but I couldn't find how.
2) I had multiple installed apps under single TOS (for example, .Arc, Lzh, and zip would all unarchive just by double-clicking on them) and I want to do the same with Neodesk, but it always blows up a dialog box for the parameters. How do I pass parameters to an installed app so it acts on the file being passed to it? (like -x for zip files)

Thanks in advance for any help! :)

*** Now reduced from $550/$500 to $450/$400!!! ***

You will not find a better TT than this with all original packaging,
boxes and manuals!

Atari TT030 computer - Faster than a Falcon, perfect condition!
4MB ST RAM + 4MB TT RAM - for greatest flexibility and compatibility
135MB internal HD - excellent condition and just the right size
Atari TT VGA monitor - 14" color screen allows 256 colors (*below)
Atari mouse
Includes all original manuals, software, disks, boxes(!)
Includes unlimited tech support via email from me, a 10 yrs
experience ST user.
All in excellent condition and guarenteed to work for 14 days $550
* The monitor has recently manifested a wobbly picture after hours
of use, a good tap on the side temporarily fixes the problem. My
dealer says it probably is a cold solder joint that needs to be
tracked down. Otherwise in perfect condition and perfectly
serviceable. The package without the monitor is $500

High Light the desktop icon, select Options/Install Desktop Icon and
enter the new group name.

> 2) I had multiple installed apps under single TOS (for example, .Arc, Lzh,

Probably you best best for passing parameters, etc would be to use
NeoDesk's Program Info File feature. There, you can really customize
the launching of any program.

Good point. Maybe ASCII editors should understand some special command
line option (to be set by a newsreader when calling the editor) that
forces saving just prior to quitting.

Any authors of popular editors (Everest, QED, 7up, STeno etc) reading
this ?

That is because you did not bother to read the docs ! Gee, why do I write
them ??

Put STinG *after* MiNT in the AUTO folder, and MiNT won't complain about
PRIVELEDGE VIOLATIONs anymore. It's only because MiNT does not properly
follow the XBRA conventions. It simply slaps it's own PrivVio vector in
place and catches the exceptions that should be processed by STinG instead.

> tried not loading the CPX's but when I run the dialer I get the same

> It's great, that there is an alternative package.

You're twisting the topic. It's wasn't about whether PPP-Connect would be sold without CAB, but the other way round. For MiNTnet, STiK or STinG users it's irrelevant if next to the CAB-bundled-with-PPPConnect offer there would also be a PPPConnect alone offer. What's relevant to them - and all those who've send me mail expressing their concern - is whether there is a CAB alone offer.

If you really felt that it's great that there are alternative packages, then you won't seriously discourage from their use by abusing your monopolistic position regarding web browsers for Ataris.

When I bought MagiC I was distraught to notice that I had paid for Ease too, a desktop that I do not like at all, that is not well suited for MagiC, and the use of which is even discouraged by Andreas Kromke. It's this part of your policy - letting people pay for something they do not want at all - with which I have real problems, and I understand I'm far from alone here.

But a RAMdisk does not use DMA, thus this is a poor comparison. A RAMdisk
can probably be programmed to use the blitter, but I doubt any RAMdisk
actually does that as the CPU alone is probably faster. Certainly a RAMdisk
that only does 2MB/s on a 68030 machine is a poor one.

Try STinG with HSMODEM and some mail program, like POPwatch or Antmail. It should
all fit onto one disk, and I believe it can be made work with 512 kB. For News,
try NEWSie, however it's larger and might not fit into memory anymore, but I don't
really know.

Certainly there is no other PPP package that has the potential to work in 512 kB.

Amazing Microprose tank strategy/action/sim game! Comes
with full manuals and original box. Also, comes with
the disks from the IBM version as well as the Atari version!
However, one of the IBM disks is corrupted, so a copy will
be needed for the IBM version to work. The Atari disks
are in perfect shape.

All for only $20 US$ shipped anywhere in Canada/USA! Not
a bad price considering the manual itself weighs a kilo!

SyQuest 88 megabyte removable hard disk system with 6 (or 7) cartridges.
Drive is in perfect condition and all carts have NO bad sectors and are
in perfect condition too. Rarely used - only used for monthly backups.
This drive can also read 44 MB cartridges.

Comes with 14 day guarentee to be free from defects.

Bare drive with 6 carts for only $400.

Bare drive with 1 cart for only $150.

Carts separately only $50/each.

Possibly available is an external case made just for this drive.
Most likely $20 _with_ purchase of the above drive.

Hi All,

Sounds Good but why reinvent the wheel when MagiC is now mature stable
and supports all the addons and all computers up to the 060 chip.

Look at the U.T.S.I WWW utilities page at:

http://ping4.ping.be/dipching-drulkhor/PRU-WWW.HTM

and you'll find the link to the author's page wher you can download
the latest version of this shareware.

You'll find also there a lot of HTML editor links ... Try them ! They
are all some different !

>and tell me how many messages are in each group, but
>when I try to get the list of postings to a particular group it goes
>into never never land I have to reboot.

I had problems when I ran STinG before Geneva in the AUTO folder.
Switched to running it after Geneva and everything works fine. I was
online with CAB 2.0 for 2 hours today with no problems.

>Does anyone have sting working with Geneva/neodesk? If so, did you use
>any special settings?

I did add the following to Geneva's path variable in GEM.CNF:

C:\STING,C:\DIALER

Now if I could just get STinG to work with Geneva/MiNT.

CS>However, in these days and times, bugfixes should be available over
CS>the Web!!! BBS isn't good enough for a world market.

But it is much easier to be admin/sysop of a BBS than of a webserver. And much cheaper. If a reseller will release updates via WWW/FTP they can't control(*) who will get a version and who not. So everybody could download a version. And it's not toooo tricky to hack serial numbers.

Besides, much more users have a modem than an Internet account.

(*) I know that there a several ways to control it, but it is not as easy as the MAUS software.

Perhaps Newsie could check the length of the text file it is planning to append to the header it creates and send off. If the file length hasn't changed, Newsie should display a dialog asking the user if this is what he/she intends. This would warn users that something has not worked right and give them a chance to cancel a probably useless message.

By the way, I am very impressed with the overall quality of Newsie in the tests I've done of it, even if I do not have a usenet news server and so must telnet in and use tin for day-to-day news use (and, as long as I'm doing that, I use Pine for e-mail too).

Anybody know of a free usenet server (and I don't mean a service like dejanews that posts newsgroups on the www, I mean a usenet news server)?

There used to be a vt-100 emulator for the ST called oddly enough vt100.prg
it still may be had on some ftp sites that's where I had gotten it from
originally. However more success might be gained by searching for Vanterm or
uniterm which has vt100 emulation in them. Vanterm should work fine if it
can still be found, then again, it's been a long time since I used either of
them but I do remember the days when I had that exact same set-up and used
PC Ditto <a software emulator> and PC Anywhere to connect to my LAN system
in the military. It was terribly slow but worked well enough.

I've had to do that twice in the 5 years since my first Atari drive died.

> PC-drives often work a little different (don't ask me why) and in most
> cases, I'm sorry to say that the special formatted disks won't be readable
> in the new drive.

The first PC drive I bought was one of the rare ones with a drive select switch (£34.95 from Maplins). It worked like a charm. Just set the drive to DS0 and plugged it in and used it.

The second one didn't have the drive select and now I have a twist in the ribbon cable. Other than the little 'problem' of making the twist, there has been nothing wrong with it.

Both of these replacements were PC drives used in my STE and they both read the discs formatted on, firstly, a 520STFM (1987-1992) with both a single sided drive and its double-sided replacement. In 1992 I bought my STE and the same discs were read with the original Atari drive and the two replacements it's had.

> Just consider this risk before placing vital things on
> special-format disks.

If you are really worried about different drives reading the discs, keep a backup of the disc, and use 80x10x2. I haven't yet found a (new) drive that can't handle 82/83 tracks, although I assume there may be some. I know that the one that was fitted in my STE was able to go to 84 tracks, although I never used that many. The only reason I didn't was because the external drive I had couldn't go past 82.

> To be absolutely sure about the functionality, keep to the 720/1.44 formats.

I'd not go beyond 830/1650Kb, with the exception of very short-term storage, ie. less than a few hours. I have used 1820Kb when backing up a drive before I repartitioned it. But if it was for any further length of time, I'd have kept to 1650Kb.

However, if you really want to be sure, just keep to the 790/1590Kb. You still have the security in that there's nothing special done during the formatting to cram the extra sector in, and you gain the extra space.

The final decision is that of the user. If they are confident that their drive can handle the extra space, and that the replacement will do so as well, then use it. If not, don't.

Thanks to all that responded to my posting and sent e-mail.

I would like to try the latest version of Mint/FreeMint with Geneva to
see if PPP-Connect will work with it.
I do have a older version of Mint installed. Think it is v.1.12 or
similar that came with Geneva, I'll try it asap.

What is the latest version of Mint/FreeMint that works with Geneva?
Where can I find it and what is the filename(s)?
Also need to find some good text files or docs. for Mint/FreeMint too.

If I get any results, I'll post them here.

Also due to my ISPs poor News Service. I cannot receive any replys to
my postings. So I have to do a search to get them. So if you do post
replys to this article, please also send that posting to my e-mail
address.

>PS. I ain't got a hard-drive neither! :(

I initially ran STik for a day, on a 520ST with no harddrive.
I never tried STing on my 520, but I think it should fit in 512K?
The Web Browser Cab version 1.5 will not fit in 512, at least I haven't
managed it.

I am just reading my Newsie .80 docs (because I have them printed) and
I cannot see it saying it won't work in 512K. Newsie is capable of doing
all the functions your are asking, and also has and easy to use FTP,
as well as a rudimentary web browser. You can see the text.
So if it won't fit in 512k, then that is unfortunate.

What I might suggest is get: The following Freeware, Public Domain and
Shareware pkgs. Your intial outlay is nothing, so it is worth a try.

STik or STing: , I guess STing Version 1.08, since you are looking for PPP.
Try to get a connection on your bare bones ST, with no other accessories
loaded. You will also need XCONTROL and HS modem.07. Read the docs, put the
driver in before STing runs. I am not certain how much memory these autos
and accs take, therefore memory may be tight and the STing dialer may not
load. Now if you get this far so that STing is installed and the
dialer will load, I suggest you do the next STep and try various mailers
and newsreaders to see if they will load.

Newsie: If it fits into 512K, then this is excellent. You will be a very
happy internet person. It is very easy to use and Needs no other support
programs other than the PPP. If it doesn't load, because there isn't
enough memory then try...

Antmail: I do believe this works in 512k. I personally never got it to work
although installation seems very simple. I believe at the time I had it
buried to many characters deep in the directory, and never new it was a TOS
problem until this week.

There are other mailers that I haven't had the opportunity to test, that you
can try to see if they will do what you require and determine if they will
run in 512k.

Now if you find that you can install STing, and get a newsreader working in 512k, then try to work a deal with your internet provider that lets you get a secure PPP connection working before you pay. This is what I did, and that way you won't feel cheated if STill there is some obstacle to overcome.

Remember
These programs are usually distributed in lzh or zip format
which means that you will need the newest versions of these programs in the junior format (runs in TTP on 520s), as the shells they use usually require 1meg.
Also there were some 520STfms with only 360K diskdrives, so this may make unarchiving files and setting up programs, just a little more difficult.

I actually ran the CAB (Crystal Atari Browser), with STing, a 520STwith 2.5meg of ram, a 2400 baud modem, graphics on, and only a floppy disk. This was all of 6 weeks ago. Your interest to get newsgroups and mail, shouldn't be overly demanding even on a floppy.

I will run the make 512K program and do some testing, however I suggest, you get the programs. If it works you will be happy. I think that there is this opinion that you need to have a pentium 75+, 32meg of ram+, a 5gighd, just to access the internet. While it may be pretty, I really believe it is the information we are trying to access and if you can access the information with a 10year old computer and 512k, then all the more power to you.

There are other possibilities, to access the information, with your computer that may or maynot, be available to you. Such as Terminal emulation, which if you followed an earlier post is being done on a 520ST with only 260k.
I am hoping others here with more experience then me can offer this advice.

Good luck
Brian.

Brantford, Ontario
Canada.

520ST Tos 1.0, SH204, 2.5meg ram.

-> >He bought a used 520ST (one of the very early ones it seems with a 360Kb
-> >disk drive and TOS 1.0 on disk).
-> >He needs it to get online (terminal emulation) and so far he's succeeded
-> >with the VT-52 emulator supplied on the boot disk.
-> There used to be a vt-100 emulator for the ST called oddly enough vt100.prg
-> it still may be had on some ftp sites that's where I had gotten it from
-> originally. However more success might be gained by searching for Vanterm or
-> uniterm which has vt100 emulation in them. Vanterm should work fine if it
-> can still be found, then again, it's been a long time since I used either of
-> them but I do remember the days when I had that exact same set-up and used
-> PC Ditto <a software emulator> and PC Anywhere to connect to my LAN system
-> in the military. It was terribly slow but worked well enough.

Well then, Back in the olden days when I used my 520ST (before I blew it
up) I used a terminal program called ST-Term. It included VT-100
emulation as well as Kermit for a file transfer protocol. I was using
Kermit until recently (because ST-Term worked on my Falcon before I got
real) and it did fine but slow. Very simple (and correctly written)
program that does great for that guy's machine. I may be able to aquire
my old distribution disk that I donated to my club's library if you
think he needs it.

Sorry, but Wrong :-) I had a lenghty discussion with the programmer on this issue, and he DOES recommend IDE because the driver they supply is heavily optimized for IDE, and allows 8 tracks. As a matter of interest, I do get 8 tracks on my old 80MB 2.5" IDE drive.

I have the following for sale:-

1) STF 1040 1meg english roms.

2) STF 1040 2meg German roms and German keyboard.

3) STFM 520 4meg English.

All of the above are in perfect working order. They are only
being sold because we have upgraded to STE's.

I also know of a 5 and a quarter inch drive, atari specific with
software for sale.

If you are interested in any of these, please e.mail me in the
first instance, and include your evening phone number:- England
only for the phone number. Anybody outside England, can phone or
e.mail me.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-729-0761 evenings EST. I am also open to trade offers.
E-mail me your list.

HARDWARE

Atari Portfolio Card Drive *NEW*. This device allows your IBM
desktop PC read and write Portfolio memory cards. Plugs into
an IBM 8-bit ISA card slot. Unit is brand new and complete $20.00

Syquest 5 1/4" 44 meg removeable cartridges. Will be HDX formated and
verified good. each $20.00

Mouse Master by Practical Solutions. Plugs into ST mouse port and
allows you to have mouse and 2 joysticks plugged into the computer
at the same time. No more reaching under the machine to plug and
unplug the mouse to play a game. Comes in original box $10.00

Monitor Master by Practical Solutions. Allows you to have an Atari
mono and color monitor hooked up the the ST at the same time. Just
press the button, no more unplugging and plugging in different monitors.
Switchbox also has Audio and Video ports on it. $10.00

Atari SC1224 Color Monitor. Unit is in perfect working order.
Comes with power cable. $60.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $60.00

Supra 2400 baud external modem. No power supply. $3.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $40.00

SuperCharger by Beta Systems. This was one of the better IBM

emulators for the ST. Best part was this was an external unit
that plugged into the ST's DMA port and had it's own power supply
so as not to put any stress on the ST. This is an XT emulator
that is twice as fast as a regular IBM. The external box CPU is
housed in a beige case with a data and power lights, also has a
reset button on the case. The case has a DMA passthru port to
allow connection of other devices. Comes with all diskettes,
MS-DOS 4.01, a copy of the instruction manual, power supply
and DMA cable. You can have IBM and ST partitions on your hard
drive and hot key between DOS and TOS. When the IBM emulator
is not in use the 1 Meg RAM in the CPU case can be used for a
fast RAM drive under TOS. $60.00

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $10.00

Gold Rush by Sierra. Complete with box, docs, and disks $10.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $10.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $15.00

MISC SOFTWARE

Moving Pixels CD-ROM. This CD-ROM has Tony Barker's programs
and source code from all the programs he ever wrote for the Atari.
Includes programs like Atax, Brushworks TT, MIDI Battle, Offical (The
official Falcon Demo used by Atari), Tina (The 70 meg Tina Turner TV
comercial), TT Wars (The Star Wars Demo) $10.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $5.00

PC Ditto by Avant-Garde Systems. This is the original IBM Emulator
for the Atari ST. It's purely software based and surprisingly
is very compatible with an IBM PC. This is the newest/last version
of the software that supports Atari mono and color monitors. you
can create an IBM partition on your Atari hard drive and install
MS-DOS and IBM programs to run from the hard drive. Comes with
diskette, manual, and keyboard template. $10.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $2.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

From: dperreau@lynx.dac.neu.edu
Message-ID: <670pv1aub1@isn.dac.neu.edu>
Source record: 111937

--

Just a quick question on SIMMS for the 1040 STE. I bought

one of the last 1 meg STE's produced a few years ago. I've

noticed that the MAC mailorder places are selling 1 meg 30 pin

80 ns SIMMS for about $20 apiece. I've thought about upgrading

the STE with these. I've seen 100 ns SIMMS mentionned for the STE

in this group. Any problems using 80 ns SIMMS? I assume non-parity

SIMMS are ok, right? Anyway I'd appreciate some guidance on this

before I spend some money. I realize I could do it more cheaply with

used SIMMS, but am more interested in new ones.

Is there an appreciable performance improvement with an upgraded

machine.

Use the machine for games mostly.

Thanks

D Perreault

> Since when does MagiC require HD Driver?

I think that HD Driver is the only driver that supports background DMA and, if so, then Magic requires it. Otherwise it's not 'required', just nice to have.

AAPOI, I turned off the background DMA since it seems to slow the system down quite a lot on an STE, which really defeats one of the objects for its usage.

I can't say much on this subject, apart from my experience with my spare STE and the SIMMs I just put in it. They were 60ns 3 chip items (3UKP each) and the STE works the same as it did before, with the exception of a lot more free space. As far as the type of SIMMs, the speed doesn't seem to make much difference, as long as you don't get 150 ns or higher (if they're still around). The SIMMs I've put in are the 3 chip type and replaced a pair of 8 chip (no parity) and 2 chip (also no parity?). I don't know for certain but it shouldn't make much difference whether they are parity or not since, AFAIK the parity bit is only checked by a PC memory controller.

Hold the control key down while double-clicking on it. Then it's listed in the Objects menu of MAGXDESK. Of course, this only applies if you're using MAGXDESK, not a replacement desktop like Ease or Thing.

Halvard,

That 520 is running the disk version .99 I think.
Unfortunately, NONE of the later software will run.
I know. I have that version and have tried.

If he has roms, then he must have an early rom set.
and this is v 1.0 (a b c or d , I think). anyway,
when my PC is up, I could send you kermit for that
machine.

drop me a line, if I can help
josephus

ps. my pc is the most unlucky PC in the country. It is
still in the shop, even after a new motherboard. I have
owned this piece of junk for 4 years and replaced every
component in it. More than once. sigh.
my ancient unstable atari 1040 v1.0 is more reliable.
j.w.

That hardly equates to MagiC requiring HD Driver. And it seems to me
that's a limitation of other drivers rather than a limitation within
MagiC.

>AAPOI, I turned off the background DMA since it seems to slow the system
>down quite a lot on an STE, which really defeats one of the objects for its
>usage.

I've just started using it with my STE, while my Falcon is in the
shop, and occasionally, my system seems to go to sleep during a read,
for as little as a few seconds to as long as almost a minute. Even
though my system is not doing anything else, really, at the time.
Have you had that problem?

KLmachine.
KL
KLUse the machine for games mostly.
KL
KL

It makes no difference what speed simms you use as the ST can only
access them at 120ns and no faster. I am using 80ns simms with no
parity in an STE,and there is no problem and no speed increase.

I have a program called "FT" (stands for file transfer) that I use
with my portfolio, parallel adapter, and pc. I am pretty sure it
would work with the serial adapter as well. E-mail me if you would
like a copy.

Do you know of any programs that would work between my TT and the
Portfolio using the parallel adapter? (then I would have absolutely no
use for the PC anymore and could throw the darn thing out the window
- best of luck with yours)

There is a program called HP_OPT26.TOS to be found in the ASH box in
Germany. Extracting this file give you optimize version 1.26 This
would do the job. BTW how about uendecoding your E mail ;-)

From: clab@buffnet.net
Message-ID: <6749uqbcr1@buffnet2.buffnet.net>
Source record: 111759

My Motorola 28.8 worked so well for me (no init string) with PPP Connect i
went out and got a ModemSurfr K56. I can't get PPP connect to send any
inti string (ATZ or ATM for example) without it mostly givig back the
string "Modem says no OK". Does anybody know the proper way to use the
init string, and which one will work for the K56 modem. The old Motorola
28.8 works fine, just thought i could get some more speed :). What string
should I send the K56 to run at the highest possible sppeed and how do you
send it properly.
Thanks to anyone who can help

>
>.Hi!
I use a TT for all my music stuff and it is great! I use Cubase 3.1,
Dr T's Omega II, along with XOR. It wont run fingers or tunesmith however,
which was a great disapointment. I also use barefoots Edit-track, Midi quest,
Stienberg 12. Most of the PD music stuff will work.It wont run Creator Sl,
but will run Logic.Other music stuff that will run is Music Mouse(lauri Spiegels
program)"M" Interactive composing system.Band-in-a-box(I like it!)
The only thing it's not too good at are games, even tho I have a lot of games,
but a lot of the time I download it, and it crashes after I run it.
Also Pagestream (DTP)runs great on it. I make my cassette covers on it.
HAVE FUN WITH YOUR TT! I DO!
TIM

>if support could be made for the DSP in the Falcon and on the STarTracker cards.

It's nice to dream, but unfortunately reality tends to get in the way. Four
years ago I was trying to get a copy of Atari Unix from Atari, and couldn't.
Despite being on excellent working terms with all of their devsupport folks.
Two problems:
ASV was too sluggish on the TT. Even after the TT CPU was upped to
32 MHz from its original 16 MHz design it was too slow. So, Atari
did not feel like it was worth marketing.

ASV license cost too much. They couldn't sell it, and they couldn't
even give it away, because they would owe license royalties to whoever
was the then-owner of the Unix brand name. I dunno what SCO would
have to say about it now, since they are the current Keeper Of The
Unix Name.

At any rate, while they did choose a good version of Unix to work with, and
got a competent crew to do the port, I think you'd do better with NetBSD or
this Linux/68k. At least the source code is available without any hassles.

4204. Re: Upgrade prices; was: CAB 2.5

Newsgroup: comp.sys.atari.st
Date: 1997-12-15 00:00:00 UTC
From: Oliver.Buchmann@t-online.de
Message-ID: <673ogmpm1@news00.btx.dtag.de>
Source record: 111764

Hello Magnus,

>CAB 2.0: 59 DM
>CAB 2.5 update 49 DM
>CAB 2.6 update 39 DM

For Poweruser:
CAB 2.0 30.-DM
CAB 2.5-Update 39.-DM
CAB-2.6-Update 39.-DM

That is 108.-DM.

Greetings,
Oliver

From: Oliver.Buchmann@t-online.de
Message-ID: <673oh0pm3@news00.btx.dtag.de>
Source record: 111766

Hello Peter,

> What's relevant to them - and all those
>who've send me mail expressing their concern - is whether there is >a CAB
>alone offer.

If we would sell CAB alone, it wouldn't cheaper. Our update-price is always 39.-DM. But we wanted to have a complete package. There are many DAUs, unable to configure a ASCII-config-file. And many of the existing tools were programmed by many authors and the readmes are in english language. In know many people (me too), they speak english very bad. I learnt only a few years english at school (but had to learn latin for ten years).
We weren't able to install the existing package STiK on MagiCMac, so we looked for an author, that will programm a PPP-Socket. And Sven made this very well.

>When I bought MagiC I was distraught to notice that I had paid for >Ease too

But since a couple of years you can buy MagiC without EASE.

Greetings,
Oliver

> I realize you would have to make lemonade from this lemon (MultiTOS), but
> a programmer of your skill should be able to do a work around :) I realize
> this is akin to walking through a cow pasture barefooted, but...

It's far worse. You're not a programmer, so you never experienced how it is
to get something working under an unstable OS. You'll see your code crash
sometimes, if you look at it the code looks absolutely fine. You look at it
with the debugger, and the code does precisely what it is supposed to do.
Then you try without the debugger, crash. It's hopeless. There is the kind
of OS bug you can work around, IF YOU KNOW IT REALLY WELL (which itself is
a problem with the MultiTOS bugs), but there is another much more nasty kind
of bugs that strike only occasionly and which you cannot work around. The OS
is there to provide certain services. If I have to reprogram all of them,
I can rewrite MultiTOS completely which then is the same sort of work. STinG
requires some services that are used by few other programs. Bugs in those
services would not be known by anybody, and they will crash the system when
STinG is used, while they don't effect it without STinG as they're not used
without STinG. So users like you would probably blame STinG, as you do not
know the details of what happens. Even me it'd take a tremendous amount of
work to find out, and then I still do not know how to fix it, and whether
I'd need the MultiTOS source code to fix the bug.

> My first experience with MultiTOS was pityful. But with the new versions
> of MiNT/AES4.10 I've changed my mind. I've posted the many prg's that work
> well with my setup. Here's a Gembench result using my 14meg Falcon/NVDI/
> Nemesis/FPU68881/MultiTOS/MiNTv1.14.5/ with 6 acc's/ 13 auto folder prg's/
> 20 cpx's and a 4meg RamDisk installed. Not exactly a clean system:

So just try to use STinG with MultiTOS. Some people do precisely this, and
they're happy, so it seems possible to avoid the bugs. I'm just saying I
won't waste any time investigating inexplicable crashes under MultiTOS.

Cheers Peter

I found that the presence of another config file in the archive (default.cfg)
intimidating, with no mention of its use or how it should be configured in
the docs. Peter's message from a few days ago would appear to say that it is
unnecessary to do anything with it if one isn't using a local network tho'.

>driver to suit IDE.

I've seen the opposite - that they recommend SCSI because you probably won't get more than 4-6 audio tracks on an IDE-drive and with a SCSI-drive you should be able to get 8 tracks.
They also recommend that you should use their own modified AHDI-driver to get the most out of the program (you can download the driver from their homepage - I don't remember their address for the moment, but you can find it on my homepage's links-section).

I had a problem with ST-Term downloading to floppy it would trash the FAT
Tables during Z-Modem Downloads. I don't remember any problems with Kermit
however. I believe the trashed floppies were caused by the "not recognizing
disk change bug" of TOS 1.0.

No!
Direct Cable Connection is very similar to Laplink. Both side of the computer
must be running similar software. Atari don't have DCC support.

>After this procedure, the null modem cables should

Double-click on the Group icon and select 'Show information' from its 'File' menu (make sure no application within the group is selected). In the Group dialogue, enter your text in the 'Name in window:' field.

>I had multiple installed apps under single TOS (for example, .Arc, Lzh,

>parameters. How do I pass parameters to an installed app so it acts on
>the file being passed to it? (like -x for zip files)

Highlight the NeoDesk icon for that application and select 'Install Application'. In the dialogue, enter the extenders applicable to it, separated by commas. Select 'Takes parameters' if you want that option before the application is launched.

Ahhh, much faster than the way I explained it <g>.

In retrospect now, I think Ronald wants to have the programs _within_ the Group to have long descriptions. To do this, if I remember correctly, the Groups have to be created from scratch. By that I mean the 'normal' NeoDesk icons have to be renamed with the longer descriptions first and then dropped into the Group. The additional file descriptions will then be saved within NeoDesk's *.GRP files.

Hi,
I have a Atari Portfolio with serial interface connector that I used to
connect to my old Atari ST and transfer files.
I have recently purchased a IBM clone Pentium 120 and am running Windows 95.
What software can I use to transfer files from my Portfolio to IBM via
serial port ??
Is there a dedicated software package (like the one I use on my ST) to
transfer files to my portfolio ?
and where can I get it ??

Thanks

Colin Todd

I think the Falcon ram disk app that Alan Evans wrote ran at about
18mb/sec from fast ram on my Might Sonic without the blitter.
I haven't tested it on the A/B yet.

Is there anyone in the San Fran bay area that has an ST that I could either rent for a weekend or pay them to transfer some midi files, and text files to a mac?

I would greatly appreciate it. Please reply via email as I don't visit these parts much.

Thanks,

Steffan

Hi,
did anyone succeed in running
the fabulous aladin mac-emulator
on whatever pacifist version ?
(Or any other ST-emulator ?)

If so, please indicate the pacifist & tos version,

Aladin itself starts ok,
but when loading an image of
the mac system disk it seems to go wrong

my trials all end up with the
sad looking bad system-disk icon

thanks for any clue

The presence on the net of aladin disks in .st format
indicate that it is possible ...

A member of our local Atari user group wants to obtain a program called IMGBUILD which he says is used for Pacifist, an Atari emulator for the PC. Unfortunately the URL that I have for this item doesn't exist anymore, so can you tell me where it can now be found?

Any assistance appreciated.

The Falcon doesn't support DMA for IDE. That's why there is no way to
use DMA background transfers (MagiC) with IDE drives.

Since quite a while no file needs to be changed anymore to get in. If you
want a GUI, it's there, use the Dialer to edit the DIAL.SCR (as you said),
and that's all what needs to be done to get on the net. ROUTE.TAB does not
need to be touched anymore, the Dialer will set the route if the "Add default
route" option is enabled (which it is by default). DEFAULT.CFG does not need
to be touched either for the first couple of logins. Later, things like full
name etc should be added, but that's all, and I consider it trivial, isn't it ?

Cheers Peter

Greetings!

I wonder if anyone knows anything about the WinSTon emulator at Fatal Design...

There is not a sign of who made it, but I understand why, if the author wants to remain anonymous, but it says on the homepage that updates would be posted once every few weeks on the homepage, and it has only been once update in about two months...

I hope it will not stay like this (it's only v.0005) since I think that it looks great and it's incredible what it can do in such an early release!

The layout of it is so clean, and the things that do run, runs better than PacifiST, atleast on my system.

Yours Sincerely, Robert Hagenstr&#65533;m

>
>Does anyone have sting working with Geneva/neodesk? If so, did you use
>any special settings?

No special Geneva settings are required. At least I didn't set anything
with an older version of STinG when it was running under Geneva.

But with my provider, I'm having no luck with the current version of
STinG. Our symptoms are similar: like you, I can get a NEWSie overview but
can't get an actual article (causing a non-fatal bus error). I can check
for mail fine, but retrieving the mail causes the same crash. But at least
STinG works for you without Geneva (not me, though). But it used to work
under both...

The problem is either an installation error (i.e., 'us') or STinG itself.
I've seen posts here by at least two other people who have STinG running
great under Geneva. The thing is, though, they're not using our ISPs <g>.

The key for both us, even though our problems aren't identical, is that
STinG reacts differently when Geneva is resident. Charles Silver is
reporting similar conflicts under MultiTOS.

If you're confident STinG is installed correctly, I'd just wait for the
next update from Peter.

> support and the development is: upgrade prices.

I know I know, but you can't charge to much anyway, or noone will buy it
and some will even change platform. You must also take care of your
customers, not steal them on their money.

For an example, do you know how much it would cost you if you bought
CAB 2.0 and then updated it every time a update got released?

I havn't got the figures here, but I can make a guess.

CAB 2.0: 59 DM
CAB 2.5 update 49 DM
CAB 2.6 update 39 DM

I have probably missed a few minor updates there as well, but this
would make 141 DM and all this in less then a year!

Cheap netsurfing with TOS..... not.

How can you charge 39 DM for an update from 2.5 -> 2.6??
Also if you have got MagiC (I guess we all wants to support ASH so
we have that as well, oh and to get CAB to work as it's ment too its
almost
a must) it's the same story. Then there is the new Emailer... probably
with a few updates a year at the same price as for CAB, who will afford
it?
I wont and that is for sure. Oh I also forgot GEMScript... and JINEE
and Pappilion and....

Also to be able to use CAB out of the box you need MagiC as PPP-Connect
is made to work with MagiC. As someone said, PPP-Connect should realy
be bundled with MagiC as it's more a OS extension which everyone get
nowdays regardless platform except for Atari ofcourse.

ASH has got some realy excellent products but there is noone who can
afford to stay up to date.

> In the shrinking Atari market this is the only way to get some money. It
> doesn't sound very nice, I know, but what is better: no more commercial
> software at all or upgrade charges?

Sure, but I guess you have to understand that people leave you as well.

> BTW: Minor updates for small bugfixes etc. are always free of charge at ASH
> if you download them from the ASH-BBS.

Sure, if you live local and can call their BBS, and how many does
that????
Also, I wouldn't say this about MagiC as most updates/bugfixes cost
money
which BTW only has features, no bugs.

Exactly! This is something I realy miss especially with MagiC which
is supposed to be a OS so you are rather dependent on getting hold
of bugfixes.

From: thechyld@pcc-uky.campus.mci.net
Message-ID: <882174438_OASIS_@pcc-uky.campus.mci.net>
Source record: 111813

Okay, this was reported earlier (I think) but I had not had it happen to me until now...I'm using Neodesk 4/Geneva, and when I run Newsie v82 under it, I'm getting some odd screen redraws. When accessing the Newsgroups, the bottom 1/2 inch of each Newsie window thats open shows a part from near the bottom of my desktop. Also, when I access a particular newsgroup, after I've already loaded the entire group, it will redraw the entire group inside of the article window instead of showing the articles from the group I just picked. Sometimes (rather infrequently though), it will then 4 bomb crash, requring a power-off reset. Anybody else having this problem or any helpful suggestions? Thanks...

Hello all,

I recently acquired a number of duplicate and unwanted items
when I bought a Falcon, so I would like to sell them. For
details see the list at the end of this posting.

Initially I would like to get rid of everything in one go. So
I'm offering it all for 30 UK pounds (plus the cost of postage
to anywhere in the UK: 10-15ukp?). If by 12th of Jan 1998 I have
not sold it as a job lot I will split it up, at which time I will
post the new details to this Newsgroup. Anyone interested in a
single item can email me an offer before then if they like.

Thanks,

Michael

> for free (or not much more) just for the PSU.

Actually, the Megafile 44's PSU is more like a TT's. Same
brand, same profile, and (I'm pretty sure) same wattage. It
doesn't look at all like an ST's PSU.

When my own megafile 44's PSU blew, I got a mini tower + PSU,
and transferred the drives and host adaptor board into it. It
worked, but I wouldn't call it easy. Send me mail if you're
desperate enough to try. :-)

My advice would be to find someone who can fix your PSU, and
forget about doing it yourself.

Regards

Yves

4246. MiNT fork?

Newsgroup: comp.sys.atari.st

Atari made a package for the Portfolio for transferring info
between it and a PC - maybe Best Electronics in the US, or the
Portfolio Club in the UK will have copies?

I use STinG with the Neodesk/Geneva combo and I didn't have to
modify anything! In fact everything pretty much gelled on the first try.

I DID have the problem you described with CAB, but that's easy to
fix. Go into the STiNG DEFAULT.CFG file and you'll notice at the end of it a
listing of system proxies (for accessing the web sites, ftp, etc.)
Either a) find out your proxies from your ISP and add them, or b)
comment them out.

One other thing I can think of - did you make sure that STiNG is
the absolutely LAST program in the AUTO folder, after Geneva and Neoload?

: I started playing with GNU Kaffe over the summer. It's huge. I never got it
: running properly on my TT, even with a gig of disk and 20 MB of RAM to run in.
: I wouldn't even try to run it on a 68000 w/4MB of memory.

I guess Kaffe (I got the sources as well) links every libary it may need
statically on a system that does not support Shared Libs. That was one of the
reasons I statret with a shared Libs Projekt. My concept is IMHO better than
the one of the new MagiC release. I just use a cookie where MagiC uses
new System calls. Mine is also Multiuser OK - MagiC doesnt even know of
multiuser... also mine runns on plain TOS as well as on MiNT or MagiC (with
some stuff better for MiNT). I guess I will change my System to use MagiC
Shared Libs and add an integrated Versionnumber Support (My System checked
Versions by calling a specific Libary Function). If you are interested
I can send you a modified new Dokumentation of my System as soon as I have
it. Then you can try to port Kaffe over to it and see if it is possible
to run then.

I must say I have the same configuration on my TT030 ... Neodesk 4 and
the latest update of Geneva and no redraw problems ... Nevertheless, I
must admit I'm using it with a Crazy Dots graphic card and of course
NVDI ET4000 ... so it's not exactly the same configuration.

> parameters. How do I pass parameters to an installed app so it acts on
> the file being passed to it? (like -x for zip files)

Select your archive application like ST-ZIP ... and go the the
desktop menu bar of Neodesk ....Select now "Options" and then "Install
applications" ... you have a field wher to fill the end of your
favorite files like ZIP, TOS and so on ...
That's all !

More than that; what ever happened to Atari System V? The REAL Unix for the Atari TT computer. This would be perfect today for the Falcon, TT, and 040/060 TT clones. These machines could fill the void left by NeXT especially if support could be made for the DSP in the Falcon and on the STarTracker cards.

No documentationhere either. What confuses me is that, even though I have it turned off, my copy of CAB seems to be selectively avoiding advertising banners anyway. I thought at first I was running out of RAM and CAB wasn't displaying select graphics for that reason, but it seems to be doing something else, as I have RAM and the only things that don't appear are advertisements.

I love the idea of ad free surfing. But it seems to me if you you turn this feature off, say you _want_ to see all ads, it should really be _off_.

If I could selectively load graphics by left clicking on the empty box that show where in the page the graphic goes, andthen selecting someithing like "reload this graphic" and teherby force the laod of this specific graphic, I would be happy.

Interesting. I have mine set to display the "Censored" graphic, so
it's easy to see just what it's filtering. And it's not always
desirable WHAT it's filtering, and looking at the path doesn't always
jive with my settings. Very strange.

I imagine that if you don't want to use it at all, you could remove
the module and maybe it wouldn't filter out any advertising banners.

>I love the idea of ad free surfing. But it seems to me if you you turn

>it?

I've had thoughts too about a new newsgroup, but without really
creating an extra one.
I take both zetnet.help.atari and demon.help.atari. and have noticed
there isn't a lot of traffic in either, probably due to them being
very specific, so how about:

zetnet.help.atari \
\
===> comp.sys.atari.uk (or uk.atari, or
/ something, but let's drop the 'st' bit)
demon.help.atari /

Incidentally, this would make any for sale ads a bit more on target,
unless somebody wanted to sell something worldwide.

>Saying that.. the vote would probably be to split the newsgroup.. but
>it will never happen.. its been tried...

Probably, but I reckon usenet needs to make an effort to change now
and again, or it may grind to a halt. It already looks a bit creaky
and could do with a shake-up.

Cheers! Simon:-)

Hello Martin,

I've managed to narrow the problem down; It's Mint that is
conflicting with STing. Whichever AES I use (Geneva,multitos,Xaaes)
I keep getting the same result - the dialler cannot find it's resource
file. (this is indicated in a dialog box).

I've made sure that STing is loading after Mint (v1.14). Zcontrol
seems to be loading the cpx's ok.

Is therere something I need to do to the MINT.CNF file?
Could you give me details of your mint-STing setup as yours seems
to be working ok?

My setup is:
Falcon 4mb TOS 4.02
ICD pro driver v 6.5.5
Mint 1.14 (get same result with v1.12)
Sting 1.08

4266. Re: SCSI-2 2MB? Nahhhh...

Newsgroup: comp.sys.atari.st
Date: 1997-12-15 00:00:00 UTC
From: Claes Holmerup <claes.holmerup@mailbox.swipnet.se>
Message-ID: <882071117.71172@mn8>
Source record: 111886

>SCSI-1: 5MB/s
>SCSI-2: 10MB/s
>FastSCSI-2: 20MB/s
>Wide-SCSI-2: 40MB/s
>UltraWide Fast SCSI-3: 80MB/s

These maximum speeds are correct, but very much depending on the
SCSI-controller.
If you look at the Falcon, due to the hardware limitations you can't go
higher than 2MB/s with a SCSI-disk - but since 8 audiotracks don't even need
that kind of speed, but much less, it's no problem at all.

>IDE: don't remember (1MB/s?)
>Enh. IDE depends on PIO-mode 0-4 (on PC's at least: 5MB/s max)
>- But is better on Falcons than on PC's because of the Blitters boost?

It's slower anyway on the Falcon - but I get almost 3MB/s with my Quantum
Fireball EIDE-disks (1.3 and 2.1GB). What you get out of EIDE-disks on the
Falcon depends much on which bus speed you're using, so with an accellerator
card you will probably get transfer rates higher than 3MB/s.

>But: IDE is cheaper because it needs the computers CPU or controller. At
>least in PC's.

Normally, the IDE-disks need more CPU-time to make the transfers and that's
why IDE isn't recommended for HD recording.
I believe that the IDE-drives are cheaper simply because of the
manufacturing volumes - all PC's use IDE (well, not ALL but a very large
majority) and the market is controlled by PC sales since PC's are the most
popular choise :(

>SCSI on PC's: max. of 15 devices connected. On Atari: max. of 7
>IDE: max. of 2 devices.

With a PC SCSI-card you can use 15 devices on a SCSI-Wide chain (Wide-HD's
have other connections too - 68 pins instead of 50-pins - because they have
a wider data bus), but if it's a standard SCSI-II controller, you're still
limited to the 7 units, just like on the Falcon.

>Please explain if you know more about this stuff.
>If IDE is so good, then why do all the PRO systems come equipped with SCSI
>rather than IDE?

The "good" thing about IDE is that they're cheaper...
I use my EIDE-disks for storing all my software and as image-disk for
CD-burning, while I use my 2.1GB SCSI-disk for audio recordings.
In fact, if you use a PC for HD recording with Cubase Audio, you're

recommended to use one SCSI-HD for the operating system and one SCSI-HD for the audio recording to make sure you can use all the possible audio tracks - not to mention the Pentium 166MHz, 48MB RAM etc.To be compared to the Falcon which works nicely with 8 or even 16 audio tracks in Cubase Audio with the "awesome" speed of 16MHz and the "impressive" RAM size of 4MB.
I use my PC mostly for Internet and games...

>I believe in SCSI.

Me too...

Best regards,

>have an Idea that this might be true.

It's not that simple always.
Some 2.5" HD's can't be jumpered as Master/Slave, but are always set to a single-drive position that can't be changed.
However, most of them do have jumpers for Master/Slave and if so, it's just a matter of soldering to get a cable that can use both drives - if you're not lucky enough to find someone who sells the needed cable. You should also use HDDriver, since it's the driver that works best in every way. Some large HD's can't be used with other drivers than HDDriver.

Well they have said that the price will be under 2000 DM _with_
DSP/Falcon card. That's not very expensive if you ask me. What is
expensive is that Hades card.... whhheeeee!

Well MagiC is expensive, unstable (compared to good old TOS) and
isn't 100% TOS/AES compatible.

What I wonder is how they got the rights to use and _modify_ TOS 4
as Atari/JTS them self doesn't even own everything found in TOS.

Not that I realy care as long as the result is good enough.

>>The latest beta of the CAB.OVL for MiNTnet supports cookies, so it's really
>>up to Dan Ackerman :-) CAB 2.7 will also manage cookies, but will still be
>>dependent on the OVL for this.

>Its in the latest beta.. just need cab 2.7 to use them.. :)

I guess I forgot to announce the end of the beta test cycle. Version 1.84 of
the MiNTnet OVL for CAB is now available for general use. You can find it at
http://highlandsun.com/hyc/

New features of this release:
Fully conforms to HTTP/1.1 spec. Supports persistent connections,
basic authorization, Netscape cookies, HTTP/1.1 cookies, and all
new HTTP/1.1 transfer modes. Authentication/authorization is also
fully supported for proxy servers, and multiple authorization realms
on the same server are also supported.

Lots of bug fixes, fewer dependencies on library internals. The
OVL is a lot harder to crash now; most of the really gross mucking
about in the OS and library has been removed. (Hm. Of course, I've
also added new ways of mucking about in the library, but that's a
different story...)

The OVL uses a separate text config file for setting email name,
path to GZIP binary, cookie usage, and memory cache size. No more
guessing about what environment vars to set, or where.

The code has undergone major restructuring to make it a little more modular
and easier to manage/understand. The old info cache (that recorded the size
and mod date of the last 64 URLs accessed) has been completely replaced by a
much more comprehensive, flexible, (and more complicated!) set of structures.
(I was going to explain it all here, but I suddenly realized that a detailed
discussion of data structures would probably bore all of you to tears. If
you're really curious, or you have nothing better to do, you can of course
read the source code and see for yourself...) But with the caching of hostnames
and IP addresses, you should see a fair speedup over previous versions.

Planned features for next release:
Native gopher handling

Base-relative/shared-text support

CAB 2.7 cookie support

MD5 Digest authorization

(PS: Yeah, I know, the code is still really ugly/poor in a lot of places. I still have a bad habit of taking shortcuts instead of doing things the nice, straightforward, textbook way. So sue me...)

Hi Gilles,
You should contact Homa Systems House (yes, in your home town!)
since they have drivers for most popular scanners, including the
excellent Microtek ScanMaker E3. If you want higher resolution scanning,
you should look at the Astra 1200S since its price has drastically been
reduce.

Current Specials:
ScanX (Microtek ScanMaker E3/E6) $70 CDN$, $50 US$
ScanX (UMAX ASTRA 1200S) $70 CDN$, $50
Microtek ScanMaker E3 + ScanX (Atari Driver) $279 CDN$, 199 US$.
UMAX Astra 1200S + ScanX (Atari Driver) $439 CDN$, $319 US$

Homa Systems House

>the Hades). But the earliest release for that is somewhere in '98 AFAIK.
>There's a French project for a Falcon-compatible machine. I don't know how
far
>they are, sorry :(
There was an article about this French Atari Falcon clone called the
'Phenix' in a Dutch Atari magazine called Atari ST Nieuws. It's in Dutch
ofcourse. I've read the article about two months ago if I'm not mistaken.
It was/is? to be a 100% downward compatible machine for low-end users
(unlike to projects like the Medusa, Eagle or Hades, which were born because
of Atari's lack of TT-support). Info on this French project is very scarce
on the Internet. Some time ago I saw a mention on a French website that's no
longer available or so it seems.

The Phenix was to come in two flavors:
one with a MC68060 CPU and one with a MC68040 CPU and a Motorola 56002 DSP.
The audio system should be compatible with the StarTrack card for Atari's
with VME buses (meaning 24-bits sampling at 96kHz!), and the whole thing
should in performance be comparable to nowadays MMX PC-contemptible systems.
Well, that's all I know, for now.

4280. TT & Games, TT & Music (Was: something with TT and musci in it)

Newsgroup: comp.sys.atari.st
Date: 1997-12-16 00:00:00 UTC
From: Werner Domroese <werner.domroese@pba.nl>
Message-ID: <6767hb$7em@news3.euro.net>
Source record: 111650

Hmmm. As for games on a TT: it would have been nice if the ST emulator Backward for Falcons was released in a TT-version. Does anyone know if it's still being updated? What's the latest version?

Also, if you're into mixed MIDI and direct-to-disk audio recording, you might be interested in a piece
of hardware called the StarTrack. It comes with a Falcon-compatible 56002 (Falcon: 56001) DSP,
records at up to 96kHz in 24-bits per sample (DCC, CD, MiniDisk: 44kHz/16bits, DAT: 48kHz/16bits,
Falcon: 49kHz/16bits, STE/TT: 50kHz/8bits), supports multichannel sampling, is modular and
chainable with additional StarTrack cards (which are installed in 19" racks because there's only room
for one VME card in your TT). Features both analog and digital i/o and filters out the copy protection bit on CD's.

The downside: it's pretty expensive. But it has no equal on ANY platform. The most expensive high-end PC audio cards cost more and do less. But the onlly way to really find out is to go out there, and HEAR this - then compare.

4281. Which Atari ST ?

Newsgroup: comp.sys.atari.st
Date: 1997-12-16 00:00:00 UTC
From: David Baxter <David@bodfari.com>
Message-ID: <882290134.2767.0.nnrp-04.9e986e4d@news.demon.co.uk>
Source record: 111651

I live in the UK and I need a ST to handle the following tasks, but I am not sure which one to purchase. I use to own a 520STFM about five years ago but I have know given this to my brother, so I know a little bit about them.

My needs are :-

1. Must be midi compatible.
2. Be-able to connect to a standard TV either through scart, phono type connects or even s-video.
3. I want to edit my home videos, I would like to be able to load them onto a HD and then edit them and record them back onto Video, if this is possible. Otherwise just straight through the ST while adding titles etc...
4. Pickup my e-mail and use newsgroups, surf the Web etc...
5. Maybe even play old STFM games!

I do hope someone can help.

Kind Regards,

David@bodfari.com

Any SIMM's faster than 120nS, it doesn't matter if they're parity or not, it'll work on an STE.....I've used two chip, three chip, eight chip and nine chip SIMM's in mine at various times and they've all worked...

The bad news is that with 512Kb, there won't be much room left after
installing STiNG to use anything really. I've just done some checks to see
how much memory various programs use and, as you can see below, there just
isn't enough room with 512Kb, and 1Mb is a bit of a squeeze, even more so
with a hard drive.

Application Memory Notes

STiNG 200Kb This is with the memory set to 60000 bytes
in DEFAULT.CFG

XCONTROL 67Kb v1.31 with just the 3 STiNG CPXs enabled.

DIALER 113Kb

NEWSie 562Kb! The lowest I could get this was 560Kb with
only the comp.sys.atari.* groups, not
including c.s.a.advocacy or c.s.a.8bit
ie. only 4 newsgroups.

POPWatch 249Kb This could be reduced to as low as 189Kb if
the retrieval buffer size is 4Kb. I'm not
sure what the bare minimum is, but I think
4Kb is about the bottom limit.

NWatch 134Kb Don't know if this can be reduced, can't
find any way of doing so.

The best thing could be done was to see if an STE can be found cheap, and
then, if it isn't already 2 or 4Mb, upgrade it to 2Mb at least.

> MagiC.

What I meant was that to use the background DMA, HD Driver is required. If that isn't something you require, it isn't actually required. Basically it's the same as 'requiring' Magic. If you don't 'need' the enhancements, like multitasking and the increase in speed over TOS, it's no more required than HD Driver.

> Have you had that problem?

I haven't noticed anything like that with my STE. When does it occur? Is it when reading from floppies, a hard disc, or both? Do you have pre-emptive multitasking on, and what are the timeslice settings? I've set mine to 20ms and 1:32, and it seems quite comfortable like that. It even seems quicker doing 3 things at once, than TOS did doing one thing at a time.

Since the dialer will be unloaded before any of the latter three things
are laoded, in theory a 520 would be able to run everything except Newsie,
even running POPWatch with STING and XCONTROL should all be able to fit at
once. But it sure is tight.

Oh, damn. Except that the O/S is loading into RAM at boot (non-techie
that I am, I often foolishly believe that stuff really runs off the ROMS).

Anybody know how much memory a clean 520ST actually has from the desktop?
If it isn't at least 516Kb, POPWatch isn't going to work.

Howard, Juhani...anyone...have you guys read the latest Computer Shopper?
One of the columnists covers Dynamic HTML (at least the Microsloth version)
and he is against Microsoft domination, but is declaring that Microsoft has
won the Browser wars/Internet because of their new implementation of DHTML,
which they are saying blows away Java or Netscapes version of HTML. It is
scary to read stuff like that, even if you have to take whats in print with
a grain of salt.

Just wondering if anyone else had any news on this... ;)

Yes, I'm using it and it seems to work just fine. Malcolm Cooke was
kind enough to send it my way tho I now understand it to be available
thru Ash's site. As far as the docs, as you say the resource files in
English and the prg seems straightforward enough to use without the
docs. Haven't had any trouble at all,whereas Zorg gave unpredictable
results in my Vfat partition while doing an excellant job in standard
tos partitions.You might try running the docs thru Ruftrade 2q.

You do the prices, that's the reason. Everybody has noticed that the CAB price went up significantly when PPP-Connect got bundled with it. I'm sure you'll have another excuse for that.

> always 39.-DM. But we wanted to have a complete package. There are many DAUs,
> unable to configure a ASCII-config-file. And many of the existing tools

I know this can be a problem for DAUs (german abbreviation for "most foolish user you can think of"). For this reason it's not necessary to edit ASCII-config files with STinG. Sure, with the first version you had to.

> were programmed by many authors and the readmes are in english language.
> In know many people (me too), they speak english very bad. I learnt only
> a few years english at school (but had to learn latin for ten years).

How could that happen ? In german schools english is the primary foreign language, latin one choice for the secondary one. How could you end up with having had more latin than english ?

Anyway I guess someone going Internet should be aware that only an estimate of one percent of the lot is german, while 80 to 90 percent of the Internet is english.

>>When I bought MagiC I was distraught to notice that I had paid for >Ease too
>
> But since a couple of years you can buy MagiC without EASE.

I bought it little over one year ago. I did not ask for Ease, that's for sure.

Bought also MagiC-Mac, got Ease a second time IIRC. Stupid.

Magnus Kollberg <magnus.kollberg**@**emw.ericsson.se> writes:

> Well MagiC is expensive, unstable (compared to good old TOS)

Hahahahaha, sorry, couldn't help. TOS had so many bugs you had to work around when programming, and it was rather easy to crash it when you were not uttermost careful. It's far better than MultiTOS, if you meant that.

MagiC however does not give me *any* unexplicable crashes. When programming, and I think of some concept that would be legal but most demanding in terms of OS performance, I start expecting it to not work, and usually it turns out that it works anyway. Try to call complex OS functions from interupts for instance with TOS, and with MagiC.

I do not use it with Falcons though, I've been told it's a bit less stable on Falcons.

> and isn't 100% TOS/AES compatible.

It is if the application programmer followed the rules that had been imposed by Atari. If you drop this condition, then "TOS/AES compatibility" is not defined, as TOS 1.2 is not compatible with 1.0 and so on. This is simply because programmers have invented strange algorithms that take advantage of some bug in TOS 1.0 that has been corrected in 1.2 (I've seen lots of programs that worked with 1.0 and did not anymore with 1.4 for instance).

So by any sensible means Magic is pretty close to 100 % TOS compatible.

If you disagree, first give a sensible definition of "compatibility" that leaves all TOS versions compatible, but not with MagiC.

> What I wonder is how they got the rights to use and _modify_ TOS 4
> as Atari/JTS them self doesn't even own everything found in TOS.

I'm puzzled by that too.

Any Atari machine machine does, though the resolution is not the greatest.
You need to use ST-Medium or ST-Low.

> 3. I want to edit my home videos, I would like to be able to load them
> onto a HD and then edit them and record them back onto Video, if this is

Whew, that needs very fast and specialised equipment. I'm not sure if it's
possible to do that with Ataris.

> possible. Otherwise just straight through the ST while adding titles etc...

Any model that can accept an external master clock can do that, for instance
the Mega STE. The basic STs cannot do that properly. I'm not sure about
1xxx STE, TTs or Falcons.

> 4. Pickup my e-mail and use newsgroups, surf the Web etc...

Any model does that. For the latter you'll need 2 MB of memory and a harddisk,
while a harddisk and 1 MB are desirable but not essential for news and mail.

> 5. Maybe even play old STFM games!

Then you'll need an ST (no E, no TT or Falcons, those will have problems
running most of those games).

Cheers Peter

O> What are they charging 2.5 owners?

The price for the 2.5->2.6 update will be DM 39.--. I think this is a fair
price when you remember there will be a completely new client in there.

The price for the E-Mailer is DM 69.--

I think one of the many advatages of the Atari is the realtively small OS in it's ROM's. Even if everything goes wrong, you can still bootup your machine with the TOS in the ROMs. So I think it should sty that way, that there's a simple and small TOS in the ROM's and all those Multitasking-add-ons on disk. With MagiC, this won't be possible.

We should remember that the upgrade CAB 2.5 -> 2.6 contains a completely new
software, the long awaited comfortable FTP-client! I think DM 39.-- would be a
fair price for this client alone.
Also please don't forget that producing software for the Atari isn't that
great buisness anymore and ASH is producing the best software available for
our favourite machines. If I look at the prices on the Mac- or PC-market
running an Atari-system is still Power Without The Price.

4319. Wdialog: some related problems

Newsgroup: comp.sys.atari.st
Date: 1997-12-16 00:00:00 UTC
From: dipching@ping.be
Message-ID: <882278954_OASIS_@ping.be>
Source record: 111689

Hi everyone !

Have you never remarked that when running Wdialog to make certain font
or print functions available like:
- The 'option' button inside the print menu of CAB
- The 'font' option inside some modules of Twilight
- ... others

Have you never remarked that even when using Geneva you are loosing
the nice 3D dialogs of some programs like those in Twilight or you can
also loose the 3D icons of CAB ... in place of them it then uses the
older one four color or 16 colors ... I don't really know ...

The only way to avoid this kind of problem is running Wdialog after
having run CAB ...

I'm aware that's not a big problem but I only wonder why this happend
?

My configuration is:
TT030
NVDI 4 ET 4000
Neodesk 4
Geneva

Note: it's not the Geneva or Neodesk fault because while not using
them, the result is the same for the icons with CAB

Thank you for any answer or similar encountered problem.

Jo

>It occured to me recently that I've never correctly set my TZ (timezone)
>variable. I can't seem to find any documentation on the correct format for
>the setting - can someone explain this?

Not all software cares about it, but the MiNTlib uses the BSD/Unix setup.
You can find the description in localtime.c in the MiNTlib source:

```
* Time zones are given as strings of the form
* "[TZNAME][h][:m][TZDSTNAME]" where h:m gives the hours:minutes
* east of GMT for the timezone (if [:m] does not appear, 0 is assumed).
* If the final field, TZDSTNAME, appears, then the time zone follows
* daylight savings time.
*
* Example: EST5EDT would represent the N. American Eastern time zone
* CST6CDT would represent the N. American Central time zone
* NFLD3:30NFLD would represent Newfoundland time (one and a
* half hours ahead of Eastern).
* OZCST-9:30 would represent the Australian central time zone.
* (which, so I hear, doesn't have DST).
*
* NOTE: support for daylight savings time is currently very bogus.
* It's probably best to do without, unless you live in North America.
```

Source record: 111692

Okay, <control> -single- click on programs within a program group allows you to give it a long filename. <control> double-click blows up a window that shows you that program's source. Cool stuff!

Okay, I had managed to setup my apps to have a single file name extension passed to it (for example JPG to the excellant Apex viewers) but what I was wanting to do was pass parameters. For example, with ZIPJR.TTP, I wanted to give it "-x ". Pat and Anna (hi guys!) suggested setting up an NPI for that particular file. I tried, but it still just blew up the window and ran zip like it had no parameters passed to it. Guess I'll try experimenting some more... :)

Thanks again to everyone for all their help! :)

John,

The latest version of STinG works just fine with both MagiC 4 and the
latest versions of Geneva/Neodesk on my TT. Configuration is the same
for both. Its just a guess - but you might want to make sure that HS
Modem is loading before STinG.

Hmm, looks like I've gone and lost most of my email/web info! However,
if you look in the AIRC docs you might find the info there - or at
least a contact address for Lp (or try via Flinny's page).

Btw, although the AIRC executable works fine under MagiC, I have no
idea if the GFA environment itself does or not!

This is unrelated, but I was wondering if you could put the connect rate somewhere in the dialer dialog? Occasionally, I'll get a 14.4k connect, after which I'd prefer to disconnect and call back to get a ~28.8k connect. However, the connect string flies by so fast, if I'm not paying extreme close attention (not even daring to blink), I miss it, and usually disconnect anyway, just to be sure.

Those SIMMs are perfectly ok. 120ns is the slowest they will take, so as
long as you're below, it's ok.

You won't see much of a speed increase with more memory, especially for
most games that were programmed for 1 Meg machines, but the 4Megs are
nice to have...

4332. FS: Winnipeg Atari ST User Group fundraiser blowout! REDUCED!

Newsgroup: comp.sys.atari.st
Date: 1997-12-16 00:00:00 UTC
From: Trevor Cordes <trevor@cyberspc.mb.ca>
Message-ID: <882258039.41C6@cyberspc.mb.ca>
Source record: 111785

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of Atari User magazine FREE! Please specify which issues you want or random.

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

%> Here's how it works:
%> CAB tells the OVL to retrieve a file and place it in
%> a particular filename.
%> e.g. D:/CACHE/a/00001234.html
%> The OVL creates a pipe, and a symlink to the pipe, at the
%> cache filename location. It also creates an actual
%> file at a nearby location.
%> e.g. U:/pipe/cabovl.123
%> D:/CACHE/a/cabovl.123
%> D:/CACHE/a/00001234.html -> U:/pipe/cabovl.123
%> As the OVL begins downloading, it writes to both the pipe and
%> the alternate file. It then returns "success" to CAB.
%> CAB opens the cache filename, which is a symlink to a pipe,
%> and starts reading from it. So, it gets the downloaded
%> data in realtime, as it arrives.
%> When the OVL is done downloading, it closes the file and the pipe.
%> Closing the pipe gives CAB an EOF. CAB closes the pipe too.
%> The OVL renames the alternate file into the original filename, thus
%> removing the symlink at the same time.
%> e.g.
%> Frename(0, D:/CACHE/a/cabovl.123, D:/CACHE/a/00001234.html)
%
%I understand what you mean but I don't know what it's worth with actual
%versions of CAB. I don't know if CAB already does some data processing
%if the file is not yet entirely available, i.e. does it start to format
%a html page when the file is not yet on the local computer or does it
%start to decompress a gif image before all data is available. There are
%many problems which need I/O suspension which is not always easy to do..
%
%Secondly I think it's time to finally change the interface to CAB. Just
%look what you suggested to do. I like your idea, it's making the best
%out of the CAB<->OVL interface but it's not really elegant...

You're right. I've thought about it some more, and I believe it's too much
work for something that won't really be usable. Oh well, not every idea works...

What about putting it (and other updates as well) on your webpage so
that other people can get hold of it as well? Calling an BBS in another
country isn't realy a great solution these days.

:I haven't noticed anything like that with my STE. When does it occur? Is it
:when reading from floppies, a hard disc, or both? Do you have pre-emptive
:multitasking on, and what are the timeslice settings? I've set mine to 20ms
:and 1:32, and it seems quite comfortable like that. It even seems quicker
:doing 3 things at once, than TOS did doing one thing at a time.
:

You know, ASH themselves refer to HDDRIVER 6 by Uwe Seimet (and CBHD) in
the MagiC manual to use with for "Hintergrundbetrieb der Festplatte".
Actually they wrote that MagiC have support for HDDRIVER 6, but for me who
never used anything but AHDI it sounds like this is a "true" upgrade for the
outdated AHDI.

If there's a shareware (or freeware) alternative I will test it at once.
I have a SCSI-chain of two HD and a Apple CD-ROM and want something stable
to drive them with.

Source record: 111589

Hallo!
Habe hier ein unschoenes Problem mit dem Ausdruck von
Grafiken auf einem HP Dj520. Alle Flaechen sind von horizontalen
grauen Strichen in gleichbleibendem Abstand durchzogen. Zu sehen
sind diese Streifen natuerlich nur auf dunklen Flaechen. Und auf
grosser Schrift.
Habe schon alle m&#65533;glichen Druckertreiber ausprobiert, in
Papyrus die Druckersteuerzeichen geaendert, ueber GDOS
ausgedruckt- ueberall der gleiche Effekt.
Nur beim Ausdruck des Selbsttestes vom Dj fand sich ein hervor-
ragendes Resultat.
Ist am Ende mein Centronicskabel falsch geloetet?
Ciao, Nico

You could try "LITTLENET" a networking program given with an ST
FORMAT readers disc. It is simple to use, just connect two midi cables from
the out to the in sockets of both computers, then you could transfer files
from the 520ST hard drive to either the hard or floppy drive on the Mega
STE.

>The address for suggestions: st_inside@gic.de / Fax: +49 431 27 368

This with Atari clones feels the right way to keep the Atari spirit alive.
Many users may "disappear" to the PC or Mac with the emulator bridges
Magic-PC/mac or TOS2WIN and finally erase these apps and the splendid
GEM-apps when they want to save diskspace for the byte-hungry systems like
MS Win98 and MS Office 97.

That TOS is under devolopment was the best news I heard this year, TOS will
always be TOS for me. To buy modern systems like MagiC, N.AES or Geneva is
o.k but TOS is something that we all share in common. Hope that TOS 6 not
will be a ROM-only system, that they release parts from it on disk, som my
Falcon can take advatage of it.

Terry May asked for info about HP_OPT:
TM>Who else is using this? Is it stable for repairing and optimizing
TM>VFAT partitions?
I'm using V1.27 and it is pretty much faster than every other optimizing tool I know because it buffers a lot im RAM, the more free RAM you got the quicker it runs. So please: if you love your partition don`t switch off your machine while optimizing! Another thing you have to take care of the integrity of your harddisk: _unmasked_ damished sektors cause loss of data.
I love the thing:)
As to your VFat-question I have to say I didn't dare it yet...;->
Try it ! and tell us about :-)

Yeah, I think that would be good advice for any optimizer. :^)

I'm just curious, does it optimize both the free space and your files
or just the free space? If it just does the free space (as Atari's
Check Disk does), that would explain a lot of its speed.

>your machine while optimizing! Another thing you have to take care of the
>integrity of your harddisk: _unmasked_ damished sektors cause loss of
>data.

What do you mean by "unmasked" damaged sectors? Do you mean bad sectors
that haven't been properly marked, and thus, not used?

>I love the thing:)
>As to your VFat-question I have to say I didn't dare it yet...;->
>Try it ! and tell us about :-)

Sure, let me be the guinea pig. :^)

I've the Logical check on my long filename partitions (though not to
correct anything yet), but not to optimize.

Greetings, In my atari portfolio there are 3 address files. They can be seen in the menu. However, they cannot be opened, "file not found". Also I cannot create a new file. Just recently I bought a 32k memory card, and tried to use it, and now we have these problems. Anyone with the same problem? I tried to use FT to transfer files to my pc to try to open them. Again, they 'list' but cannot be read.

Thanks in advance
Tom Doran

> for it ?

I don't know if anyone is writing TADS games on the Atari anymore, but one of the advantages of TADS is that a game written on one of the development platforms should run on any of them (provided that platform was supported at the time that that version of TADS was released). TADS is no longer being developed by its original authors, but people still write games for it. You can find more information in rec.games.int-fiction and on that newsgroup's archive site ftp.gmd.de.

You've just reminded me of my most hated part of programming for TOS!!

That's the case where you have spent hours and hours racking your
brains over some source code in which you can't for the life of you
find the "bug" ...

... only to find when you reboot there isn't one - TOS just decided to
become unstable.

Since I got it, I've used it quite often. The physical check isn't as good as the one in CORRECT.PRG (part of the Kobold package) but the logical check is just as good.

As for optimizing VFAT partitions, it seems perfectly stable. Sometimes it seems to take quite some time when the partition is almost full.

One final word of warning though, make sure that any partitions it's used on don't have any physical errors. If there are, and they aren't marked as bad, it will probably destroy the partition.

The STe will run the vast majority of STfm games, at the time of the
STes release it was said about 5% of games did not work, I personally
think that is a great overestimate.

I think part of the problem is that the file begins with an HTML comment
instead of the tag "". CAB is very strict about what it receives; if
the document doesn't follow a strict order of tags, it won't be displayed.

E.g., in CAB 1.5, a document must have ,

4353. New at Systems For Tomorrow (December 17th)

Newsgroup: comp.sys.atari.st
Date: 1997-12-17 00:00:00 UTC
From: sales@SystemsForTomorrow.com
Message-ID: <679qp7$doo@uucp.tfs.net>
Source record: 111606

New at Systems For Tomorrow December, 17th 1997
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Scan X: UMAX for TOS Computers $49.99
This new edition of the Scan X scanner drivers provides support for the UMAX Astra 1200s and VISTA S-12 scanners. A MicroTek E3/E6/35T+ version is also available. From Homa Systems.

RAM Gizmo /w 14MB for Falcon030 **SALE** $99.99
Wow! RAM prices sure have droped over the last couple years.. This is by far our best price ever on the 14MB Upgrade card for the Falcon030. Under $100 (well a little) for a RAM Gizmo populated with 14MB! Limited quantity available. From chroMAGIC.

Operation SKUMM for Falcon030 $49.99
If you love to kill terrorists, this game is for you! Blast the bad guys as they pop onto your screen. Kinda like duck hunt, but the theme is more humane than killing those poor ducks. :) Features True Color Graphics! From Logiton.

HD Driver 7 for TOS Computers $49.99
Latest version of the best Hard Drive software you can get. Upgrades from v5 or v6 are available for $25. The return of your manual and disk are required for the upgrade, Email for details. From System Solutions.
** sold out, new stocks will be arriving soon **

CAB 2.5 /w PPP Connect for TOS Computers $49.99
The long awaited update to CAB is now shipping. All preorders have been processed, and we have limited stocks remaining from our first shipment. CAB 2.5 includes several new features and Plug-Ins, plus it includes PPP Connect, a TCPIP stack for MagiC, to allow easy internet WWW access. From System Solutions.
** sold out, new stocks will be arriving soon **

Aazohm Krypht for Falcon030 $49.99
Enter the merciless world of Aazohm Krypht and confront 5 different fighters in a True Color battle to the death. This is a beat-um-up style fighting game like Kasumi Ninja or Mortal Combat. It contains violence and some bad language, so it's not for the kids. Must be 18 to buy. From Logitron.

Radical Race for Falcon030 $49.99
Radical Race is an exciting new top view racing game (ala Power Drive Rally on the Jaguar) with an important difference: guns! Requires 4MB RAM and a Hard Drive. Jaguar PowerPads are
~~~~~~~~~~~~~~~~~~~~~~~~~~~

supported. From Logitron.

Xplore CD for TOS Computers $24.99
This German disc contains mostly German PD and Shareware software
(How did that happen?) Also includes a collection of fonts and
graphics for Calamus. Plus a few full version programs such as
the ToXis virus killer. From Seidel Softwareservice.

Electronic Cow!
Three cool music applications! For more information check out
the Electronic Cow link on our web site!

MIDI Arpeggiator for TOS Computers $27.99
Sound Chip Synth for TOS Computers $19.99
Snippit Synth for TOS Computers $29.99

Also Available:
Alien Thing (Expert) $19.99 Alien Blasting fun!
Tetris II $11.99 Cool Tetris game
Power Up $19.99 Racing fun for ST/STe/TT/Falcon
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
Face Value $69.99 Visual style GFA programming
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
MIDI Maze $4.99 The classic happy face shooter!
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

That makes some sense, although it implies a strange definition of the
word 'require'. You do "require" MagiC in order to do multitasking, or you
can use MiNT and third party AES to achieve the same result (sounds funny).
Same for background DMA, with CBHD under MagiC you can do background DMA
too. Note background DMA works even if you do not use any harddisk driver
at all.

Not very thoroughly it appears to me :

> STiNG 200Kb This is with the memory set to 60000 bytes
> in DEFAULT.CFG

That's just not true. With ALLOCMEM=60000 it takes 145 KB, loading all modules.
Restricting to the essential ones, only 135 KB is required.

> XCONTROL 67Kb v1.31 with just the 3 STiNG CPXs enabled.

That might be right, but it's all XControl working memory, from the CPXs there
is just 512 Bytes resident. But there is a simple trick that causes this figure
to be almost irrelevant. Rename XCONTROL.ACC to XCONTROL.APP. This way, it
won't start automatically, you need to double-click it, but also it terminates
and removes itself completely as soon as the window is closed, which means no
memory is kept resident.

> DIALER 113Kb

This cannot be counted either, as you can terminate the Dialer after the
connection is established, and all memory is released again. This number
is alright, though.

You forgot one thing though, which is HSMODEM, which is required with such
old machines. It takes about 15 KB.

The above is all that is needed to set STinG up and establish the connection.
As XControl and Dialer can be started one after the other, the total memory
need up to now is 135 KB + 15 KB + 113 KB = 263 KB, which is probably small
enough that it'd go even into a machine that runs TOS from RAM. After termina-
ting the Dialer, only 135 KB + 15 KB = 150 KB stay resident.

Still the ALLOCMEM can be lowered a bit more, although eventually it'll get
tight. Around 32 KB is probably the absolute minimum, which would give another
30 KB.

> NEWSie 562Kb! The lowest I could get this was 560Kb with
> only the comp.sys.atari.* groups, not
> including c.s.a.advocacy or c.s.a.8bit
> ie. only 4 newsgroups.

Whew that's quite a lot. I didn't know that. Doesn't NEWSie use dynamic memory management ? John, are you there ?

> POPWatch 249Kb This could be reduced to as low as 189Kb if
> the retrieval buffer size is 4Kb. I'm not
> sure what the bare minimum is, but I think
> 4Kb is about the bottom limit.

Also more than I expected. Gary, is this true ?

> NWatch 134Kb Don't know if this can be reduced, can't
> find any way of doing so.

This sounds like a reasonable figure.

So even if the NEWSie/POPwatch/NewsWatch figures are right, you cannot really call it tight on one MB systems if TOS is in ROM. I agree it's tight if TOS works from RAM, though. And NewsWatch at least should easily work even on a 512 KB system.

> The best thing could be done was to see if an STE can be found cheap, and
> then, if it isn't already 2 or 4Mb, upgrade it to 2Mb at least.

That's certainly a good option, as they are so cheap nowadays. But the E does not make any difference, if it's a 1040 ST or 520ST+ (one MB) with TOS 1.4 it's just as good.

Cheers Peter

Have you got the latest SERIAL.STX from my web page (in MODULE.LZH) ? Check
out if the one you've got is 19188 bytes long.

If it is, check the Dialer's "Save debugging information" and do a login
attempt, and send me the resulting DEBUG.LOG as e-mail.

"might".

>Background disk fileoperations (Ref to latest issue of ST Computer).
>Yihaaa!

This would only make sense with a multitasking kernel. That would be
either MiNT (which does not yet support that without major rewrite)
or something new. Do you really like the idea, compared to MagiC
which has been there all these years?

>This is really something.
>Now the next logical step is, which processor will Milan use? 68060? and

Will this fix my problem? It's not stability and faster screen redraws
that I'm after, it's keeping the computer from thinking that everything
needs to be twice as tall or half as wide. I'm not looking for something
to throw my money at not knowing for sure if it will be a solution or not.
What I'm looking for is some kind of patch, setting, or other easy,
inexpensive way to keep the computer from doing this. Is there one?

>sure.

You got the EASE only with the MagiCMac If you got it twice, this was our fault.
The EASE was only bundled with MagiC!2 and MagiC!3. And then with MagiCMac and MagiCPC.

Greetings,
Oliver

Hello Magnus,

>? If you update CAB you want to
>_update_
>CAB and not buy a new program!

The update is good for users, they want a ftp-client. If you are only interested in CAB, you better wait for the next update.

> ASH is now trying to force
>people
>to buy programs they doesn't want as they can't upgrade just CAB >without
>getting another program.

You can wait for the next update. If we would sell Fiffi as a separate package, the CAB-Update would also cost 39.-DM or we would wait for the next version of CAB, to offer an update.

If you think, the Hotlist is the 39.-DM worth, then buy it. If not, wait.

>And as CAB cost 69DM now (including Fiffi and PPP-Connect) it's >actually
>cheaper to buy a brand new copy every _second_ update of CAB. >Something
>is very
>wrong here....

If you buy every year a new car, you will also pay more money than somebody, who "updates" his car only all ten years.
There is nothing wrong. There is a lot of work to do, to send you an update and there is als "Hardware", discs, manuals etc.

Greetings,
Oliver

Message-ID: <216_mike@bbsgate.interware.REMOVE.TO.REPLY.it>
Source record: 111618

Seems strange but I can't make any cli understand reading a file instead of stdin to redirect arguments.

```
ls | expandar
mkdep < list
```

The argument coming to the program is always empy, with okami, CMD or mupfel CLI, where am I wrong ? Doing:

```
dir | more
```

does work well, so what ? I am programming in C but this should not be the problem, the environment is magic+thing.

Does anyone know if there are any Cannon printer drivers available for the above (for the Atari, of course!). I know that Cannon printers can be run in Epson emulation mode, but not at the best possible resolution.

Any suggestions (apart from don't use a Cannon printer!) welcome.

Try the small ads in Atari Computing magazine (issue 7 out now!), or it may be a good idea to place a cheap advert (often free) in your local newspaper in the computer sales column and see if you get a response.

Best regards

4370. mk Linux on my Mega Ste?

Newsgroup: comp.sys.atari.st
Date: 1997-12-17 00:00:00 UTC
From: jbg@enterprise.aacc.cc.md.us
Message-ID: <3497270c.0@aacc-alpha>
Source record: 111695

I am a Linux admin and also a part-time Atari enthusiast. I have an Atari Mega STe and a STf. I want to install Linux on my Mega, I read that you have to have a 68020 or higher because of PMMU support. Now for my questions.

1 - Is there still a card available that can upgrade my processor to a 68020 or higher? I heard of a PAK/3 (68030), I think this can work for Linux. But where can I get one? Are there anyothers? And does this card use up the expansion slot in the back of my Mega?

2 - I'd like to network my Linux PC with my Mega (hopefully running Linux) with ethernet TCP/IP networking. Would a NIC card use that I guess it's a VME slot in the back of the Mega? You see I'd need it for the NIC, BUT I'd also need one for the PAK/3! Ah! What to do.

I'd really appericate ANY help that anyone can give me, I'd love to get this project going but I think that my current machine is a little too under-powered to handle it. Let me know what I should consider doing, I'm trying to show my co-workers that these little machines are most than just glorified midi keyboards! Thanks in advance!

According to Chris Krowchuk at Computer Direct, the problems with
MagiC and Falcons stems from the endemic hardware problems found in the
original Atari versions; when the necessary hardware patches are done,
or if you have a C-Lab Falcon, which has all the problems fixed, MagiC
runs very stable.

personally I'd like to get MagiC 5 just to try this out on my
Nemesised Falcon, which of course fixes the original problems (and I'd
certainly like to have the long filename support). Alas, as I'm
planning yet another UK trip for the spring of '98 as soon as they
announce the next Atari shows (yes, I'm a glutton for punishment :)),
it may have to wait for awhile yet.

> 1 - Is there still a card available that can upgrade my processor to a 68020
> or higher? I heard of a PAK/3 (68030), I think this can work for Linux.

That is correct. You need a PAK/3. And perhaps a FRAK/2 (not necessary but a nice add-on), FRAK/2 = fast Ram card for the PAK (uses PS/2 simms).

> But where can I get one? Are there anyothers?

You can get it from mw electronics in germany.
The FRAK you can get directly from the developers in germany. -> PM for more infos about it.

>And does this card use up the expansion slot in the back of my Mega?

No. It is mounted above the original cpu. All you have to do is to insert a PUSTE (Pufferplatine fuer STE, buffer device for STE) on top of your PLCC cpu and insert the PAK into the PUSTE. The slot remains empty (e.g. for graphics cards).

Why don't you use N.AES? It's faster, uses MinT and is the successor of MultiTOS
(uses AES 4.10).

I use it on my falcon and it is fantastic.

> CAB-2.6-Update 39.-DM
>
> That is 108.-DM.

Okey. But I do wonder how this PowerUser works. If I understand it correctly you become a poweruser when you have bough a product from ASH. So if I have got a a copy if MagiC I actually is a poweruser, or??? Is this only valid if I buy it directly from ASH, or does it count if I buy it from another retailer, like System Solutions in UK or FPC in sweden?

So basicly anyone who has bough a prodcut from you is actually a poweruser or?

So as I have bought MagiC 5 I will be able to buy CAB for the poweruser price through FPC in sweden?

Anyway, I still think 39DM for an upgrade is ALOT of money, especially as the program only cost 30DM when I bought it.

Also, nice to see someone from ASH in this newsgroup.

4378. Atari still Rocks!

Newsgroup: comp.sys.atari.st
Date: 1997-12-17 00:00:00 UTC
From: james.burr@acpu.com
Message-ID: <882336133@acpu.com>
Source record: 111703

Scannimg some of the other newsgroups ie comp.amiga.marketplace I notice that our Atari newsgroup has much more positive and informative conversational activity about our platform then they do theirs. On that particular above mentioned newsgroup those users have resorted to Clinton bashing with profanity. The like I actually almost never encounter on our humble family oriented entertaining loving newsgroup. Even so, the number of message postings on our newsgroup is as much trippled at times compared to that particular group. The content and demeaner of our messages (helpful and supportive in nature) proves that we are still alive and devoted to our computers. Thanks to everyone who contributes here with the help they offer to us who are ignorant (not in a bad way) and need advice. It's nice to know that even without the vast commercial support other platforms have that we are fortunate enough to have a place where we can come to for support. In our predicament it's a necessity for us especially being worlds apart it seems.

Later
James Burr
Boise, Idaho
jdburr@acpu.com

P.S. I was scanning through the dictionary on how to spell the word 'necessity' when I came across the defination of the word 'nemisis'. Nemisis being - 1. Someone or something that is being just cause for punishment 2. Just punishment for wrongdoing 3. An unbeatable rival.

My point being that I wanted to buy a Nemisis board for my Falcon but according to the defination of 'nemisis' I might be punishing my computer. No, I'm making it an unbeatable rival. Ha!

>
> We should remember that the upgrade CAB 2.5 -> 2.6 contains a completely new
> software, the long awaited comfortable FTP-client! I think DM 39.-- would be a
> fair price for this client alone.

So why not sell the new client alone? If you update CAB you want to
update
CAB and not buy a new program! There are FTP clients for STiNG and if I
want
a FTP client for CAB I will buy it but now we are talking about updating
CAB not buying new programs!

> Also please don't forget that producing software for the Atari isn't that
> great buisness anymore and ASH is producing the best software available for
> our favourite machines. If I look at the prices on the Mac- or PC-market
> running an Atari-system is still Power Without The Price.

We all know this, but that isn't the point. ASH is now trying to force
people
to buy programs they doesn't want as they can't upgrade just CAB without
getting another program. I do think this is wrong and doesn't you agree
that
it does sound a bit strange?

Wouldn't you be angry if you wanted to update MagiC for a bugfix but you
would
have to pay 39DM becuase you get a notice program that noone uses
anyway? But
the Notice program alone was worth 39DM....

And as CAB cost 69DM now (including Fiffi and PPP-Connect) it's actually
cheaper to buy a brand new copy every _second_ update of CAB. Something
is very
wrong here....

Well noone is selling TOS 6 as it's not available. The developers of
Milan are working on a new TOS for the Milan computer. It will be based
on TOS 4 and they will later add more stuff to it and release it as
TOS 6. This is the short story.

Regarding what it will have, I don't know, but it will probably have
everything you want.

All I can say is you're not alone. To be honest, I've given up.
Despite my having posted detailed information twice to this grop no-one
has been able to say exactly what part of the negotiation is failing. I
can re-post if anyone is willing to have another go.

If MiNTNet is an option for you, then go with that for now. I actually
find it a very clean interface to the net. If you need it, there is
limited information available on my configuration, key files etc. at the
site below.

>a little bit of extra work. I don't mind-Neodesk/Geneva -rocks-! ;)

Actually Jo Vandeweghe had the best suggestion (control-single click on a file within a Group to rename it). I didn't know that <g>.

I'd recommend you do the upgrades from Geneva 4 to 5 then 6. Many little nuances have been added, one of them being better management of Groups. Geneva 4 wouldn't remember the window positions if they were changed again. 6 does now. Also, I remember a few icon arranging problems within a Group. That's gone, too. And 6 is faster...

>
>Whew, that needs very fast and specialised equipment. I'm not sure if it's
>possible to do that with Ataris.

There's equipment and software for just about *ALL* Atari's, but mainly
focussed on Falcon, the VME-bus machines (Mega STE & TT) and
all new German Atari clones. I think it's probably cheapest to do it
with a Falcon and a ScreenEye. Seems to beat some PC Pentium II
configurations and specialized hardware in terms of both price and
quality.

Talk to mabn@xs4al.nl (www.xs4all.nl/~mabn)

>> possible. Otherwise just straight through the ST while adding titles
etc...
>
>Any model that can accept an external master clock can do that, for
instance
>the Mega STE. The basic STs cannot do that properly. I'm not sure about
>1xxx STE, TTs or Falcons.
STE's, TT's and Falcons have no problems at all with it. Regular ST's (that
is
pre-STE era) need extra equipment.

>> 4. Pickup my e-mail and use newsgroups, surf the Web etc...
>
>Any model does that. For the latter you'll need 2 MB of memory and a
harddisk,
>while a harddisk and 1 MB are desirable but not essential for news and
mail.
>
>
>> 5. Maybe even play old STFM games!
>
>Then you'll need an ST (no E, no TT or Falcons, those will have problems
>running most of those games).
Falcon: Backward offers compatibility with about 70% of STFM games.
STE: runs 99% of STFM games just fine (well at least the 1040 STE)
Known problems: you need to shut down the cache and bring the CPU
clock down to 8MHz forthis to work. I believe there's lots o' PD software
out there that could do this? If you've got more than 1meg, you'll
sometimes, for VERY specific games need to emulate only ONE
meg availability. There's a bunch of PD programs that can do that,
just fine - even with bootable disks.

TT needs a fix to emulate 24-bit adressing in stead of its native 32-bits. There's a PD program for that. It runs most mono games. Color gives trouble. It's a real shame that something akin Backward isn't available for the TT.

The Fuji lives.

It looks like you have got a problem with ASH Emailer as you don't get
any new line
at the end of the line. Anyway, I can understand this, but wouldn't it
be possible
to do as Gribnif does with Geneva and only upload patches which you run
and will
update your files? In order for the patches to work you must have the
original in
the first place.

I don't see the point in suppling a new set of disk every time anyway.
This is
only for minor updates ofcourse like bugfixes etc.

> >Calling an BBS in another
> >country isn't realy a great solution these days.

4393. Long filename support

Newsgroup: comp.sys.atari.st
Date: 1997-12-17 00:00:00 UTC
From: Werner Domroese <werner.domroese@pba.nl>
Message-ID: <678l72$ece@news3.euro.net>
Source record: 111718

MultiTOS/MiNT had long filename support if you used an installable
file system (like the Minix file system).

What's the benefit of using Windows 95's VFAT/FAT16 system for
long filenames that MagiC uses, besides Win95 compatibility?

I mean, in 1998 Win98 (enhanced FAT-compatible sys called FAT32 with fixed
4k clusters)
and Win NT5 (NTFS, HPFS, FAT16) will hit the markets, to later be merged
into one operating
system mainly supporting NTFS (more unix and OS/2 like) in stead of a FAT
system?

Show me some light if you have :-)

The Fuji lives.

Before you buy Gemulator, take a look at the shareware TOSBOX program. You can download it from the Atari Interactive site and the registration is only US$10. It seems to be very compatible and fast. Unlike Gemulator which translates every thing Atari at runtime, TOSBOX, I believe, has parts of the OS in native Intel format which speeds things up. Anyway, it's worth taking a look as there's no risk to you if it doesn't work.

This is also off topic, but:
I'd like to see an alternative to the cpx usage for dialup
connections. Maybe an autoprogram to set the serial port and the
"activate" function built into the dialler.
In the docs, there's a mention of something called "Confsting" which
seems to be intended for this. Have you abandoned the idea, Peter?

Sometime it's better you got all from one hand, but that's not the point.

Sure, i don't like the TCP/IP socket politcy of some 'houses', but the
software how i got for my money looks nice.
All programs are in the same outfit. That's one point more.

Otherside i use STinG in the same way. No discussion.
The best way for me is to use cab, emailer with StinG, but that's
a fucking socket problem.

STinG is allways faster as Iconnect.
CAB? right, V 2.7 is in test.

He,

As I don't use Geneva very often I can't speak about Geneva but with
Thing 1.20 there is a problem too.

As soon as you load WDIALOG V1.97 from autofolder before Thing, Thing
will not display the window box text. I found that this problem is
related with NVDI. If I use WDIALOG without NVDI 4.11 I don't have
this problem.
Loading WDIALOG from desktop solved the problem though.
BTW: Thing 1.09 doesn't have problems either. I've spoken to the
programmer of Thing and according to him it's a WDIALOG problem.

I did that. I still can't use it.
I don't know if this has something to do with it but when I look to
U:\proc\ I notice two cab.00?. One 1.3 mb and the other one 98 kb. The
multistrip says 'cab' and 'cab+mintnet'.
When I use my usual setup -N.AES/MiNT/MiNTnet/Thing1.20/gluestik- I
only have one cab on the multistrip.

Magnus, not sure if this is true...but I read somewhere that the EOS (sp?)
TOS 1.4 compatible upgrade that came out a few years ago was reverse eng.
from TOS (something about it being easy because TOS was written in "C"?)
and that MagiC developed from this... :)

I thought that the NPI's looked to be extremely powerful and flexible.
I think it would be more accurate to say that I didn't set the parameters
up to be -passed- correctly, not just that they weren't set up right. (but
I'm splitting microscopic sized hairs there!) :)

>For example, I always start Edith with the -nodesk parameter passed;
>this way it runs in a window, sans desktop. Sometimes, I start it by
>dragging a file to its group name; it loads the file and still runs in
>a window.
>
>Should work just the same for passing parameters to zipjr.ttp.

Well, I tried to set it up so that any file that ends in *.ZIP gets passed
to it, with the command "-x " in front of it, but I've not had any luck yet.
I'm sure (like you said) that its me, so I'll keep on hacking at it, and if
I find the correct solution I'll post it...

Thanks for your help! ;)

My 6-year old had a Christmas play this evening, and one of the things that they did was have 30 students rep. 30 years back, and show what was the hot selling toy/fad for each year. They lined up as they did this, and what did I see? Atari, for the year 1977, and right in the middle of the line-up...

Seems not everyone has forgotten... :)

PS Kinda ironic-it was the schools TAG
(Talented and Gifted) group who did
it... :)

TOS 6.0 is under development and will be released in '98. No, you can't buy it
now. Nobody knows about the advantages but it will be a multitasking-OS and
should include modern features. Sory, that's all that can be said so far.

I don't think anyone has called this new development "bad news," but
many people are are perfectly happy with their current OS (such as
MagiC), so they just don't see it as "good news."

Yes I have heard this as well and I guess there is sone truth in it, but
how does these GEMDOS errors accure? Also "Speicerblock zustï¿½ret..."
or whatever it says, can hardly be a problem with hardware but poorly
written
programs and the lack of memory protection in MagiC. In a decent system
this
would have given you a buserror, not a reboot. ASH made fun of the lack
of
decent memory protection in Windows when they are sitting of a product
which
is even worse. But they have never claimed that it do have it either so
I
guess that is forgiveable.

Well I guess your problem is that the button/dialogs/windows get
"smaller"
right? This usually has to do with which video mode you orignaly use.

If you use something like BlowUp it will replace _all_ resolution in a
specific
colour depth with the new extended one. So if you set 320x200 you will
still
get, lets say, 800x600 but the AES (or whatever it is) first thought
that
you would use 320x200 so it set the objects after this and they become
smaller.

Well to try to fix your problem try to set 640x480 insteed of 320x200
and it will look okey again. I think... then there might be a problem
with interlace mode ofcourse causing this not to help you.

NVDI will not solve this however.

4438. Re: TZ variable - how to set?

Newsgroup: comp.sys.atari.st
Date: 1997-12-18 00:00:00 UTC
From: gryf@hrzpub.tu-darmstadt.de
Message-ID: <67ataqema1@sun27.hrz.tu-darmstadt.de>
Source record: 111544

In article <PR0SCVG@tos.pl.net>,
mb@tos.pl.net (Mario Becroft) writes:
> It occured to me recently that I've never correctly set my TZ (timezone)
> variable. I can't seem to find any documentation on the correct format for
> the setting - can someone explain this?
Quote from environ(5), HP-UX:

-- cut here --
TZ TZ sets time zone information. TZ can be set
using the format:

[:]STDoffset[DST[offset][,rule]]

where:

STD and DST Three or more bytes that
designate the standard time
zone (STD) and summer (or
daylight-savings) time zone
(DST) STD is required. If
DST is not specified, summer
time does not apply in this
locale. Any characters
other than digits, comma
(,), minus (-), plus (+), or
ASCII NUL are allowed.

offset offset is the value that
must be added to local time
to arrive at Coordinated
Universal Time (UTC). Off-
set is of the form :

hh[:mm[:ss]]

Hour (hh) is any value from
0 through 23. The optional
minutes (mm) and seconds
(ss) fields are a value from
0 through 59. The hour
field is required. If off-
set is preceded by a -, the
time zone is east of the
Prime Meridian. A + preced-
ing offset indicates that
the time zone is west of the

Prime Meridian. The default
case is west of the Prime
Meridian.

rule rule indicates when to
change to and from summer
(daylight-savings) time.
The rule has the form :

date/time,date/time

where the first date/time
specifies when to change
from standard to summer
time, and the second
date/time specifies when to
change back. The time field
is expressed in current
local time.

The form of date should be
one of the following :

Jn Julian day n (1
through 365).
Leap days are not
counted. Febru-
ary 29 cannot be
referenced.

n The zero-based
Julian day (0
through 365).
Leap days are
counted. Febru-
ary 29 can be
referenced.

Mm.n.d The d day (0
through 6) of
week n (1 through
5) of month m (1
through 12) of
the year. Week 5
refers to the
last day d of
month m. Week 1
is the week in
which the first
day of the month
falls. Day 0 is
Sunday.

time Time has the same
format as offset
except that no
leading sign ("-"
or "+") is
allowed. The
default, if time
is not given, is
02:00:00.

While the STD field and the
offset field for STD must be
specified, if the DST field
is also provided, the system
will supply default values
for other fields not speci-
fied. These default values
come from file
/usr/lib/tztab (see
tztab(4)), and, in general,
reflect the various histori-
cal dates for start and end
of summer time.
-- cut here again --

Hope that helps ...

Ciao

Thomas

>
>Strangely enough quite a few people actually use STinG with MiNT, so it
>can't be that hard, can it ?
>
>Have you checked the DIAL.INF file ?

Yes I have now, the DIAL.INF file was in the DIALLER folder, seemed
odd so I put it in the root directory and now the dialler works fine
under Mint. Strange how this did not matter when not using Mint.
I had already got around this by loading the dialler as a program.

I still have the following problem though:

The dialler connects to my provider, but after the script is done I
get the following dialogue
" Passing connection to sting ..... FAILED"

This only happens under Mint, everything works fine under normal TOS.

As you say, quite a lot of people have Mint and STing working so I'm
looking forward to getting this sorted. Then I'll go on to a new AES.

Cheers! Simon :-)

Source record: 111549

You haven't specified what driver you need. From your problem I gather
you're printing in the text mode. In the graphic mode it doesn't matter
if the text is plain or italics.
If you're using any program with configurable drivers like 1st Word+,
That's Write or Harlequin, you can safely use all the "ESC P2" codes or
if you don't want to create your own drivers, use any sensible driver
for Epson LQ 100, 850, 570 etc.

I would say better, since Correct gets rid of long filenames. :^(

In what way is Correct's physical check better?

>As for optimizing VFAT partitions, it seems perfectly stable. Sometimes it
>seems to take quite some time when the partition is almost full.

That's not surprising, going slow on almost-full partitions. Good to
know it's stable on VFAT partitions, though.

>One final word of warning though, make sure that any partitions it's used on
>don't have any physical errors. If there are, and they aren't marked as bad,

Well normaly it doesn't say what causing it, just a GEMDOS error. I know
that is usually the runnign applications fault, but how good is it if
the whole
OS comes down on you just because of this? I don't think that would be
acceptable in most other cases, but in Atari world it looks like we have
to live with it. Go the easy way, blame the hardware.

> >> So by any sensible means Magic is pretty close to 100 % TOS compatible.

> > It is, but it isn't 100%.
>
> Hopefully. I don't like all those bug of TOS. If it would be 100%
> compatible, it wouldn't have multitasking but all those TOS bugs ;-)

It's still more stable and I havn't ever come across a bug in TOS while
I have been coding. I guess you need to do some realy specific
programming
to encounter them. I bet that you can find one or two in MagiC as well.
But I guess you all are coding such a advanced programs that you
encounter
them all the time.

> > Not all, but as I said you do expect it to be compatible to the latest

>
> What about some examples? Which AES calls do you miss in MagiC?

Popup and sub menus. Now you need to run a patch to get them so they are
not a part of MagiC.

Toolbars which are very usefull. You can use them to get dialogs in
windows
very easy and also, toolbars like in CAB ofcourse.

Extended shel_write codes for launching applications. If they do excist
atleast I havn't managed to get them working. MagiC has got one or two
but
not all.

Also some dialogs looks realy funny, like textfields which get white
backgrounds when they should have the background colour.

I guess I can find a few more if I need to.

> > why not try
> > to make it AES 4.1 compatible first? It wont make anyone happy if they
> > doesn't foollow the "standard" which AES 4.1 is. When that is done they
>
> Which standard AES 4.1? Atari never released any version of AES 4.1.

I guess you must have lived on another planet but AES 4.1 is very well
known
and _is_ defacto standard. All the new calls are documented and if Atari
never released it how come that I have it? Maybe not to the public, but
they
sure released it for developers. I guess N.AES must have made it all up
then
as it's AES 4.1 compatible. Even MagiC has got some of the features
which is a
bnit funny as it was never released. Which was the latest version
released with
MultiTOS anyway?

Another major disadvantage is that MagiC lacks good documentation. If
MagiC is
the succesor of TOS we realy need some decent documentions for it in a
language
which the majority of people on this planet speak. Something like the
Compendium
but for MagiC.

Nicolai,

I understood your German; I hope you can understand my English. There are many possible causes to the problems with lines in solid areas. The first thing to do is try different paper. If that doesn't help, replace the ink cartridge. I have had to replace some more than once to get one that works properly, and your dealer should replace them at no charge. Finally, there is a possibility of a problem on the HP's circuit board. If the printer is under warranty have it checked out. If not try and trade it in. Fixing it is not cost effective. (The board problem happened to mine after several years of reliable use.)

>
>So what made him come up with that conclusion ???

Peter,

More than likely he reached this conclusion because he could not simply insert a CD and press the 'Setup' or 'Install' button. I am quite happy with cruising the internet with my Atari, but I can see how someone easily dazzled by 'eye-candy' and instant gratification might prefer Netscape or Internet Explorer.

To those who fall into that category I can only say: "Save your pennies (or francs, or lira, or rupees, or whatever) and go for one of those new-fangled Pentiums". They're getting cheap enough that it's not a MAJOR outlay of cash, and maybe those of us who enjoy our computers can get some peace. <g>

Take care,

It's certainly possible that it was a TSR conflict, as I never investigated that possibility. I don't run a whole lot of TSRs, though (because I like to multitask), and most of them are pretty much indespensible.

The only screen saver I was using at the time was Silkmouse (I'm now using Oat Bran).

I'll probably do without until I get back my Falcon and then I'll try it again on that machine.

Thanks for the response.

Hi all !

There is now available a binary of the MiNTnet CAB OVL version 1.84
with SSL support enabled. URL's beginning with https:// are finally
available to CAB users also ...

It uses SSLeay v. 0.8.0 and you can find it from;

http://www.netppl.fi/~jasivu/files/ssl_ovl.zip

Juhani Sivusalo E-Mail: jasivu@na.netppl.fi

People already on the net, might not see the need, however, for those who
live in a cave with 10 year old STs or have purchased a used ST for cheap
will not be aware of such obvious facts, therefore I think it would be a
well received by those who don't keep up to date on anything:-).

>
>
>> b) STing will not run without HS modem. I set STing modem to 2400

>into the docs.
>

I just got the latest docs, and typicall of most users, haven't actually
read whats changed;-) I do remember reading the part about HS modem not
being required if you have TOS 2.0 or later. However it wasn't obvious to
me in my first reading that it wouldn't work with earlier tosses running a
low speed modem such as a 2400. I don't think think this is a major problem
as there are probably not that many people using 2400s etc.. Just me testing.

>> c) STing works fine IF: Since I use the PAP function of STing, I am

I did edit this to no avail, however using the same dial.scr and cfg, with
the New version of STing, has solved the problem.
>
>> ii)I don't use the find function. I simply send name, send password
>> and GET-IP.
>
>Whooh ! That doesn't work with many ISPs.

I STill have to do it this way. I have been given all the IP information,
but can't seem to Find a damn String. It works, so until I change providers
it shall remain this way. I am not recommending doing it this way, I am
just saying I do it this way, and maybe someone else might try it do as a
last resort, which it was for me at the time.
>
>
>> I have tried everything to have the 127.0.0.1 not show up. But it continues

>
>Some of these problems will disappear with a newer STinG. The others are
>configuration related (see DIAL.SCR).

The problems did disapear totally with version 1.08. I kept the same
dial.scr and altered nothing. Very Nice. I even get to see the IP I was
sent now. Much easier to use.

>Also more than I expected. Gary, is this true ?

That's about right. I've just checked and on my system POPwatch takes 178kb
if it's set to a 4kb buffer. 4kb is enough if you just retrieve small
emails. Obviously you could retrieve a 800k email using just a 4k buffer but
it would be a lot slower.
The program's TEXT and DATA segments are about 80k (the size of the file on
disk), the resource file is another 22k. The remaining 70k is various
workspace and buffers. I can't really make it any smaller. It's written in
assembler as it is :)

>> NWatch 134Kb Don't know if this can be reduced, can't
>> find any way of doing so.
>
>This sounds like a reasonable figure.

No way this can be reduced. NEWSwatch has it's own retrieval buffer that
I've set 30k. Didn't see the point in allowing it to be configurable.

Cheers,
Gary

Hi Folks

I have been asked to post this by a mate.

He has an atari St, and a reynolds keyboard, does'nt known
the first thing about computers, but knowns that its possible
to connect they keyboard to the computer via the mdi port.

Is there a FAQ guide about the ST and keyboards ?

> Don't ask me what *that* means, though!

It means that the program tried to use memory that it shouldn't. It's probably a sign that it tried to allocate a block of memory and didn't check the returned value (0 if unsucessful). Then it probably tried to use that as the start of the memory block, giving the 2 bombs since it should run in user mode.

Well, I've got another question. When using Cab v2.5/STing under Neodesk and Geneva, I'm getting a little bit of a slowdown. Under single-TOS, I get an average ftp rate of around 2700cps. When I use the same combo under Neodesk/ Geneva, it slows down to around 2200cps. I went to 5 different Web sites and downloaded 5 files with each, just to make sure. This is not critical, of course, but I was just wondering about it. Thanks! ;)

I just read a post from Systems For Tomorrow, selling the Ram Gizmo from Chro-Magic for only $99.00, and thats with 14 megs of Ram. Take note however, that if you are going to be using a Falcon with Nemesis installed, you need to avoid any Ram card that uses 30-pin SIMMs, instead of 72-pin SIMMs, as it will cause video problems. (this came straight from Titan Design after I had the aforementioned problem)

But what if you don't want the new FTP-client? What if you're happy with
the FTP-client you already use? Or you don't want to use FTP? Why not
let people who want it pay DM39 for the FTP client, and charge a
reasonable price for the CAB upgrade?

At this rate it's going to end up where we have to spend a bloody
fortune on internet software that we don't want just to get the latest
version of CAB.

Source record: 111572

Okay, I downloaded SPIN!. Now what? I'm German illiterate, so I have no idea how to install the thing.

I figured out CONFIG.SYS, but I don't know what all I need in the AUTO folder and what all I need in the MagiC extensions folder. There are two files for both the AUTO folder and the extensions folder, but do I use all of them, and if not, which ones do I use?

Come to think of it, I don't quite have CONFIG.SYS figured out. It refers to a iso9660f.dos file, but this was not included in the archive. Where do I get it?

Any and all help will be appreciated.

Its probably because Geneva is a multitasking OS and there is a little
overhead for that.

> like it had no parameters passed to it.

Apparently, you didn't correctly set up the parameters. The NPI
dialogs let you control pretty much any parameter your hardware
supports when starting any application, including passing fixed and
variable parameters to the application.

For example, I always start Edith with the -nodesk parameter passed;
this way it runs in a window, sans desktop. Sometimes, I start it by
dragging a file to its group name; it loads the file and still runs in
a window.

Should work just the same for passing parameters to zipjr.ttp.

No they aren't. Most is pretty good, but there are a few that are definitely
inferiour to other software, STinG in the case of the TCP/IP stack is only
one of them.

Maybe because CAB.OVL for PPP-Connect doesn't support authentication ?
I can well imagine that they do not like the idea that people had to use
MiNTnet or STinG to d/l it.

No, just hadn't found the time to tackle that. I guess I'll have to soon.

Why don't you want to use the CPXs ?

> main dialer window!!

There is a problem with this. The way the modem reports the speed is in no
way standardized. If the user specifies 'CONNECT' as a success string, I
can display the number after that, as the connection speed. What do I do if
some other success string is found ? What do I display in that case ?

An additional problem is that you can configure the modem to give any number
in the connect string, or report the DTE speed (Speed of the serial line,
not the phone connection) instead. I can imagine getting flooded with e-mails
by completely confused or even annoyed people.

That's not quite correct, you're confusing an FPU (floating point processor)
with a PMMU (paged memory management unit). It's the latter that's required
for Linux (like any Unix). It's built into the 68030, but the 68020 needs the
68851 PMMU as an add-on, and AFAIK it's not included into any upgrade card.

It's possible that it's due to some bad bugs that were in WDIALOG until recently. I know this because part of the dialog between the guy investigating the bugs and the Behnes (WDIALOG authors) went through my mail account ;-)

Try to get a WDIALOG as recent as October or November 1997. Maybe that fixes the problem.

That a bit naive view of the things. Note they want to do all sorts of add-ons,
so possibly this TOS 6 may be just as far apart from TOS 4 than MagiC or MiNT
with NAES is. So it's possible that this will become a third system on the
market competing with MagiC and MiNT/NAES/Geneva (which is ok as long as they
remain sufficiently compatible) with the only additional thing in common with
TOS (compared to MagiC) is the name.

There is not much info available so I'm just speculating here, but this is
definitely a possibility.

As I understand it, ASH did not license TOS, but rather reverse engineered it. As far as what Atari/JTS owned or didn't own, it is my understanding that DRI is not an aggressive litigating company like Apple and Microsoft. I am not aware of what other companies than DRI own portions of TOS.

With his USR modem it is easy to specify a minimum, maximum, or a connect
only speed.

If &U0, &N14 = connect, only at 28,800.

If &U is set >0, then the &Un setting is the minimum and &Nn is the
maximum connect speed, where n = 0(disabled)
~....
n = 14(28,800)
~....
n = 31(57,333).

The FT program for transfer via the parallel port will not work through the serial port. It also won't work with all PC parallel ports: it turned out to be dependent upon some lines that weren't supported in everybody's parallel port. As I recall, it only works with parallel ports that are setup for two-way data transfer.

If you have the serial port module for the Portfolio, that with a null modem and a terminal program work just fine for swapping data with any computer. There was an excellent little freeware terminal program with xmodem protocol for the portfolio. I think it's called "xterm." The tricky part was getting it transferred to the Portfolio without a terminal program to transfer it with. One method was to transfer it in ascii text form along with a small converter that would translate it back to an executable once they were both on the Portfolio. Another method was with a special version of Xterm that would transfer itself directly across the serial connection into the Portfolio.

I have Xterm in my PF and would be happy to copy it to anyone's memory card who needs it. I'm not certain what the postage might cost from and to overseas, though. There are bound to be users closer than I am.

There is a socket on the PAK where you can insert a standard PGA MC68882 up to
50 MHz. There is also a MC68000 for compatibility reasons mounted on top of the
PAK.

See my previous posting. It has a socket for a standard PGA MC68881/2 on it.

> How much should I expect to pay for this? what is the
> buffer board for it? Whats that cost? So much money! :(

Speed is expensive but remember that a MSTE with PAK/3 50MHz, FRAK/2, PUSTE is extremely fast (faster than a TT) and you also get a modified TOS 3.06 with it. ;-)

Can you give some further explanations about PHA$AR? What is it?

> advice about this before investing.

Depends on what you want to do with your emulator.
For a real ATARI environment emulated on a PC (or MAC) you should take a look at MagicPC/MagicMAC with NVDI PC/MAC. There you have a real multitasking ATARI with all its modern features like OLGA, Bubble-GEM, I-Connect etc.
If you only want to use a single Application you can try out TOS2GEM, for games I would recommend PacifiST.

For all of this apps there are demos available on the net.

Haaahahahahaaa! :-)

Well you are wellcome to come home to me and I will crash MagiC in 2
seconds
with programs which run just fine on TOS 4.04. I can't speak for TT but
on the Falcon it's rather easy to crash. You can however learn what to
do
and not to do.

So you mean that you have never seen those "funny" GEMDOS errors? Now
when
GEMDOS sources for TOS are dowloadable on the internet you would think
that
they could fix those things.

> MagiC however does not give me *any* unexplicable crashes. When program-
> ming, and I think of some concept that would be legal but most demanding

> interupts for instance with TOS, and with MagiC.

Well I guess you have got a super version of MagiC then and probably use
that little program by Uwe which writesprotect the memory area there
MagiC
is located. The problem is that this program doesn't work on a 040. Also
it's usually enough to get a lost pointer to crash MagiC and send it to
the
moon.

> I do not use it with Falcons though, I've been told it's a bit less stable
> on Falcons.

Well I don't have any major problems with it but it is rather easy to
crash
and some apps it just hates.

> > and isn't 100% TOS/AES compatible.
>
> It is if the application programmer followed the rules that had been

> instance).

Yes that could be a reason abd that is a problem. But if a program works
on TOS 4.04 you expect it to work under MagiC as well. It's supposed to
be a upgrade and not the other way around.

> So by any sensible means Magic is pretty close to 100 % TOS compatible.

It is, but it isn't 100%.

> If you disagree, first give a sensible definition of "compatibility" that
> leaves all TOS versions compatible, but not with MagiC.

Not all, but as I said you do expect it to be compatible to the latest
AES and GEMDOS versions released by Atari as it's an upgrade, or maybe
I missed that somewhere. There are _plenty_ of AES calls that MagiC
doesn't
support and insteed of comming up with new MagiC specific calls, why not
try
to make it AES 4.1 compatible first? It wont make anyone happy if they
doesn't foollow the "standard" which AES 4.1 is. When that is done they
can play around doing whatever they want.

Oh, MagiC doesn't use the FRB cookie correctly either causing problems
on
machines with Fast-RAM.

> > What I wonder is how they got the rights to use and _modify_ TOS 4
> > as Atari/JTS them self doesn't even own everything found in TOS.
>
> I'm puzzled by that too.

Yeah, but who cares as long as it works? :-)
Atari is dead and it's better someone continues where they stoped
instead of moaning to much.

And when did ASH get involved in all this? BTW. Is it true that MagiC
is just TOS reverse engineered with some goodies added to it? :-)

Anway DRI doesn't excist anymore. DRI were bought by Novel which was
bought by Caldera which released CP/M to the public. The complete GEMDOS
sources are downloadable on the net. Regarding the VDI I don't think the
sources are available but something is.

Probably because it was never finished. I think the closest to TOS 5 was
4.92 which is available and probably is what Milan TOS will be based on
together with AES 4.1. But it's still TOS 4, just that it's very close
to
5.

Well I would asume it to be bundled with the computer, or do you mean
that the Milan works without any OS? That would be cool.

> - MagiC actually is as stable as TOS on my machine,

And I guess that is a TT? Very strange as MagiC is developed on a TT.
Hmm... maybe Atari put in some kind of hardware copyprotection
in TOS 4 and the falcon as it's the only OS that is stable on it. Maybe
an internal dongle? Has anyone found it?

> - MagiC is more compatible to TOS than MultiTOS/MiNT, and adding
> any kind of multitasking to TOS 6.x will create similar problems.

Ofcourse, but TOS is still TOS and MagiC is still not that MagiC.
That said I like MagiC and use it every day it's just that a new TOS
could be soo good as Atari were just starting to get things together
when someone got a brain malfunction and started to make toys.

> MK>What I wonder is how they got the rights to use and _modify_ TOS 4
> MK>as Atari/JTS them self doesn't even own everything found in TOS.
>
> Well, they probably sublicensed their rights.

And what does that mean? That it's illeagle?

This is circular reasoning. 95% of your customers speak German because
70% of your products are only available in German, half of them aren't
even described in English anywhere, and there is a 20% markup in price for
anyone buying your products outside of Germany.

>folder, but do I use all of them, and if not, which ones do I use?

OK, if you are smoking Magic:

Move METAXBS.PRG to \AUTO and rename to .PRX (it NEVER needs tp be
PRG).

Move SPINMAGC.XFS to \GEMSYS\MAGIC\XTENSION

Move CONFIG.SYS to \AUTO and edit it to suit.

If you are not running CBHD or HDDriver v7 move SCSIDRV.PRG to \AUTO

Re-boot and install the CD device on the desktop.

>Come to think of it, I don't quite have CONFIG.SYS figured out. It
>refers to a iso9660f.dos file, but this was not included in the
>archive. Where do I get it?

OK. Here is mine set up for the CD device on TT SCSI ID 2 being known
as logical device Z:

```
-----------------------------------------

; Example configuration for SPIN!

; CD-ROM on TT SCSI 2 (8 + 2 = 10)
*BOS, c:\auto\spin_sd.bos, A:10

; installed as logical drive Z:
*DOS, c:\auto\iso9660f.dos, Z:A

-----------------------------------------------
```

You don't have to put the drivers in /auto - they could be anywhere.

The iso driver is distributed with Metados. Do you have this anywhere?

I guess you may be short of iso9660f.dos and scsidrv.prg. Give me a
shout and I'll pack and e-mail, Terry.

Any idea where I can find it?

>I think WDIALOG is supposed to run as late as possible in the auto
>folder It works fine with NVDI 4.11rx. What is Thing doing in the auto folder?

Aarch, damned language barriere. Thing isn't loaded from
autofolder ofcourse. What I ment was that in my case I <must> load
WDIALOG from desktop otherwise I encounter the above mentioned
problems.
Also the running order seems not to be important. Even loaded as last
auto program I do have problems if I use NVDI 4.11rx too.
Remember, Thing 1.09 doesn't have this kind of trouble.
I said this before, according to Thomas Binder it's a problem of
WDIALOG and not of THING 1.20

Yes, someone warned me about this possible response: touchy lot he said; be careful! Well, he was right still, the few e-mails I've had asking me to post the games suggest that some people are interested in acquiring them - after all you can't buy them anymore and I'm not selling them. What is the problem - "images" are available for every other system including the Amiga. Do you thing that if I wrote to Psygnosis they'ld sell me a copy of Shadow of the Beast for ST? Who made OIDS? Do they still sell it? Hmm.. see what I'm saying.

Look, I think that you are the ones with the problem - the problem is that your virtue takes no account of reality. Many people have acquired ST's second-hand and cheaply: they don't have a great deal of software and can't buy anymore. If I thought that what I suggested would harm ST development of commercial games I wouldn't have suggested it. I thought that it went without saying that it wouldn't - obviously not. Please look at the facts and stop being so precious. Btw, have a look at some messages in this group written by people asking where they can download

"images" of games - such as OIDS - for use with emus.

As for me having copies of software: I can honestly say that those who don't possess pirate software - or copies - are few and far between.

On Thu, 18 Dec 1997, Magnus Kollberg wrote:

> Well I guess your problem is that the button/dialogs/windows get
> "smaller"
> right? This usually has to do with which video mode you orignaly use.

Well, I'm not sure if we're on the exact same page with this idea. What happens is, with interlaced modes and truecolor modes, no matter what resolution I start from, the window buttons become half-width and SpeedoGDOS fonts become double-height. It's not the worst problem in the world, but it's somewhat annoying. I was trying to get a resolution that was able to fit a complete page from Atari Works on one screen. The resolution I selected could only be gotten on my machine with an interlaced mode, and would have worked if the fonts weren't double-height. Also, with CAB, in any higher resolution Truecolor mode I create, it does the same thing, making it kind of strange to look at. I try reducing the font size, and it just makes them skinnier and harder to see.

> If you use something like BlowUp it will replace _all_ resolution in a
> specific
> colour depth with the new extended one.

Not so with Videl Inside. It replaces the built-in video mode selector with a new one, showing a list of all the created resolutions like so:

640x480 64kc
800x608 256c
880x640 256c
1024x768i 256c
1280x1024i256c
800x608 16c
880x640 16c
etc...

You can then double-click on the resolution and color depth you want and it's there.

> So if you set 320x200 you will
> still
> get, lets say, 800x600 but the AES (or whatever it is) first thought
> that
> you would use 320x200 so it set the objects after this and they become
> smaller.

With this program, I've pretty much always started from a 640x480 mode, or a higher one, created while using this mode. The AES seems to adjust to the created modes instead of thinking they're the original mode. For

instance, let's say I'll start in 640x480x16c, the buttons are the right proportions. I'll create and then select 880x640x16c non-interlaced, the buttons are still fine. I'll then create and select either a truecolor mode (say 640x480xtc) or an interlaced mode (say 1024x768x16c) and the buttons become half-width. The same will happen if I start with 640x480x16c and create and select 640x480xtc directly.

> Well to try to fix your problem try to set 640x480 insteed of 320x200
> and it will look okey again. I think... then there might be a problem
> with interlace mode ofcourse causing this not to help you.

Like I said, no matter what resolution I start from, it's always the same.

> NVDI will not solve this however.

Yeah, I don't see how, either, unless it replaces the AES, which I very much doubt. If you want to see what I'm talking about, download Videl Inside (which in my opinion is much better than the BlowUp software, and can still make use of the new resolutions allowed by the BlowUp hardware) and try creating your own high-resolution truecolor mode or interlaced mode. Maybe you could figure out what's causing the problem. Thanks for your advice!

Hi,

If you could state what driver you need (NVDI? That's Write? First Word+? Calamus?) it would be easier to help you. Basically, you need a separate printer driver for each of these programs and you can use an Epson LQ570, LQ800, LQ100 driver - the first one includes colour. I think I have some Epson drivers for all of these programs - so if you know what exactly you need, contact me. Or just browse in your disk collection - you'll probably find Epson drivers together with your programs, as really Epson is the most standard printer that exists.

Let's see if I can help.

1) Set up a NPI for zipjr.ttp which has the parameters
-x $$

2) Save this file as zipjr.npi

3) Highlight the zipjr.npi file

4) Select Options/Install Application

5) Add ZIP to the Doc type

Save the NeoDesk desktop.

Okay, when you DC on any *.zip file you should get the desired
results.

I don't think doddle is the word.

After much discussion with System Solutions about fitting a PAK to my Mega STe myself, I gave up on the idea and bought a TT. Avoiding 'timing problems' seemed to be the big bugbear

Another is that you have to rehouse the computer or move the power supply outside.

Yeah! No. What I meant was a comparison of TOS 6 sold to owners of
existing machines compared to what MagiC costs.

>> MK>What I wonder is how they got the rights to use and _modify_ TOS 4

Come on. I think *you* are bit negative.

You were asking something, and I answered that based on the information I have (from that recent fair). And this information says that this box will have a 68040 and no on board Ethernet.

If this information is outdated, please correct me.

>and not to do.

So do you claim that MagiC itself has a bug, or that it is "just"
not rebust while running programs that are themselves buggy? Do
you claim that these programs are OK and it is MagiC's fault?

>Well I guess you have got a super version of MagiC then and probably use
>that little program by Uwe which writesprotect the memory area there
>MagiC
>is located. The problem is that this program doesn't work on a 040. Also

Well. Nor does it for a disk based TOS or MiNT. But in theory you
can put MagiC into ROM. But that's only useful if you keep running
programs which overwrite other people's memory :-)

>it's usually enough to get a lost pointer to crash MagiC and send it to
>the
>moon.

I agree that it would be nice if this would not happen, but that's
hardly a bug. Missing memory protection is just that: a missing feature.

>Yes that could be a reason abd that is a problem. But if a program works
>on TOS 4.04 you expect it to work under MagiC as well. It's supposed to
>be a upgrade and not the other way around.

So then please tell us where MagiC is incomptible to TOS 4.04. But
please omit things where TOS 4.04 itself is incomptible to other
TOS versions :-).
>Not all, but as I said you do expect it to be compatible to the latest

Please be more specific.

>Yeah, but who cares as long as it works? :-)
>Atari is dead and it's better someone continues where they stoped
>instead of moaning to much.

That's correct. But it should be allowed to mention that there is an alternative which is *not* dead and which already has everything promised for that new TOS.

Big grin.

That would be Mandarin.

Or do you talk about the language that most Atari users speak (which would make more sense to me...). That would probably be German.

I don't know if you have room, but how about just putting the entire
connect string up there and the user should know that it's just being
shown what's came back from the modem? If you don't have room, you
could truncate it, which should still leave plenty of room to see
the connect rate. That should also be easier for you, since you
don't have to find or guess at the connect rate.

Thanks for the advice. I'll do that.

Thanks to a very fine person who sent me email, I got it up and running. Runs pretty good so far, though for awhile I was getting a "device not responding" error on bootup, and the cure was turning the drive off and then on again. Weird.

It seems a bit slower than ExtenDOS Pro, though I haven't done any benchmarks yet. Memory use seems about the same, though I'm only using 4k buffers in ExtenDOS, and Spin says it's using a 32k buffer (is that configurable, anyone?)

Unfortunately, it didn't cure my background DMA problem on my STe. It still 'falls asleep' during some reads, sometimes even during the boot process (after the AUTO folder, though). So I guess it's probably a conflict somewhere.

4531. Atari Items for sale.

Newsgroup: comp.sys.atari.st
Date: 1997-12-19 00:00:00 UTC
From: Scott Boesken <scottboesken@harborcom.net>
Message-ID: <349A457E.5B54@harborcom.net>
Source record: 111470

Atari items for sale: For the ST family. 8 bit stuff at bottom of
list.

1. Actual Atari mouse with Atari logo on it.Two buttons and a DB9
connector.

2. Stereo Master for the ST & STE. by Microdeal. Has a cartridge port
input box,software and cable. Comes in like new condition in the box
with
all paper work and user manual copyright 1991. Real time digital sound
effects
and will interface with a external MIDI keyboard. Plays frequencies
from
3.0 to 28 Khz in ST mode and 6,12 and 25 Khz in STE mode.Pretty cool.
Like new.

3. PageStream V1.8 This a earlier version of PageStream. Comes
complete
with 2 floppy disks, a three ringed binder manual and a printed box to
hold
everything. This is one heck of a desktop pudlisher program. Good
condition.

4. Golden Image Deluxe Paint with animation. Comes with 3 disks and
manual.
The program does graphics, fonts, animation, printing and the whole
shabang.
Serious graphics program. Like new and alot of fun.

5. Zany Golf. 2 disk program. It's miniature golf on the Atari. What
a
hoot this game is. Very realistic action. Mouse driven with very good
graphics.
This program made me late for a wedding once. No,not my own, That is
another story.

6. A three volume set of Atari ST and megaST books by Ralph C.Turner
The books cover the basics to advanced levels of knowledge and use.
A must read set of books for new users. This is the Atari manual you
never read.
Very good books in very good condition.

7. Falcon: The F-16 Fighter Simulation by Spectrum Holobyte. Atari
ST/Amiga
version Comes with a large user manual, 2 floppy disks and a code wheel.
Excellent fighter sim.

8 bit stuff:
1. Atari 800 computer with BASIC XL catridge. It has 3- 16 K modules
and 1- 10 K memory module. What do you need that much memory for?
2 cartridge slots, and my favorite, 4 (joystick) DB-9 ports. The Basic
XL
cartridge comes with manual. Computer comes with transfomer and printed
computer cover. Ready to go, very good condition. Just add a
television
and floppy drive. Which reminds me.

2. Atari 8-bit 1050 floppy drive. This 5.25 external (get it?) floppy
drive
in the original box (which is rough) and ready to go. Very low
hours on the drive which is in excellent condition. My friends brought
me up to
16- bit ST very quickly, hence the low hours on this drive.

Submit your offer, as sig members requested, to me e-mail only.
Most items can be shipped very cheap. Hardware is a bit more.
Shipping is paid by the purchaser.
I need to get these items out of here and I would like them to be put to
good use!
I have posted this add in the past and have many renigs. If you want to
buy,
I will sell. I am in Ohio, U.S.A. for shipping concerns.
My e-mail address again is scottboesken@harborcom.net

Go to my homepage to find info about the Falcon and its use in my studio, troubleshooting, magazine articles written by me etc.
I've had over 1600 visits for the moment - that's well above my own expectations :)

I'll add a new page to the troubleshooting section after x-mas, with Cubase Audio compatible harddisks (as well as some that don't work). If you can make a contribution to my small but growing list, please send me a mail with as much info as possible - if you can replay 8 tracks simultaneously, if timestretch works - just about anything you can think of. If you can test the HD with HOWFAST, please do and let me know which harddisk driver you use (HDDriver, AHDI, ICD or whatever). Don't forget the exact modelnumber and manufacturer of the HD...
Your contribution to this list will be of great help to many members of the Atari community, so please take time to write me a letter.

Best regards,
Claes

It's in the manual for my Sportster which is a couple of years old, I think it was int he manual of the one had a few years before this one too.

> So what would be the command to set a minimum 28,000 and maximum
> 33,600 connect rate?
&U14 for the minimum of 28.8
&N16 for the maximum of 33.6

You need to add them to your standard init string, if it's something like "AT&F1" at the moment then the replacement is "AT&F1&U14&N16"

4538. HELP!!! Atari ST UPLOADS.

I've got quite a few 'cracked' commercial games - pirates - on disks.
The copy protection is disabled but the boot sector is still intact; how
could I upload the games to ftp or whatever with the boot sector so that
other people can use the software? There must be a way.

My Courier manual is Copyright 1994.

>&U14 for the minimum of 28.8
>&N16 for the maximum of 33.6

According to my manual (which predates 33.6), there is no &N16,
but &N14 gives you a fixed rate of 28.8k. Everything above &N0 gives
a fixed rate. But the addition of &U could very well have changed
that in later flash updates.

>You need to add them to your standard init string, if it's something
>like "AT&F1" at the moment then the replacement is "AT&F1&U14&N16"

Actually, I use ATZ. If it works, I'll just write it to nonvolatile
memory and continue to use ATZ.

Thanks!

I know a lot of people have Sting working, so I'm sure the problems somewhere here on my end - I've read the docs and the faqs and but I'm still stuck. Spoke to a guy at my servers who said my numbers seemed good. I can dial up, login, and connect OK.(SLIP) I can even ping my host OK, but Newsie tells me: DNS Qwery - can't resolve host, Mail - no connection etablished, and Cab gets stuck resolving... Nameserver and Domain Name are OK according to my server. I'd very much appreciate any suggestions that could be passed my way. I'm using MagiC 5.03 NVDI 4, Newsie 82, Cab 2.5

Finally parted with my old ST. Now I've still got some stuff left over.
I'm GIVING IT AWAY to anybody who wants to gome and get it. First here
gets it, I'm not expecting a big demand though. Contact me by email for my
exact location.

jamesk@bigpond.com
(Brisbane, Australia)

General inventory - Atari ST Power Pack (20 games), Vindicators (Arcade
Tank Game), Ultima V (Game - though I think it has a serious bug), Tac-2
(joy stick), STOS (Great little easy to program game writing language, with
manuals - loved this package), STAC (Text adventure writing language, with
manuals), approx 60 disks of misc stuff.

4545. HELP!!! Atari ST UPLOADS.

-> Gareth Davies.

-> To reply remove the _ character from the reply to address.
-> garethd@dial.pipex.com

First of all, you're an idiot, and what you are attempting to do is
illegal and stupid.

Second, you have in your possession illegal copies of pirated commercial
software which violates the copyright laws, and is a crime.

Third, it's people like you who make it hard for anyone who commercially
developes software for our Atari computers (who of which is far and few
between) from considering staying in our market. With people like YOU
they can't make money and they won't support our computers.

That's why it's stupid. I respect my computer therefore I have respect
for those who write software for it. I hope you do something even more
stupid that destroys ALL your software. Don't be an ass.

I urge no-one to support this jerk with the criminal activity he wants
to do.

Later
James

Oliver.Buchmann@t-online.de wrote:
Hi Oliver,

To sum things up, I'm a poweruser as I have bought MagiC since version
4.
That's good news.

> >So as I have bought MagiC 5 I will be able to buy CAB for the >poweruser
> >price through FPC in sweden?
>
> I don't think so. Poweruser-prices you can only get directly from ASH (as far as i know).

Shouldn't you know? ;-)

But this isn't such a great idea becuase why should I buy it through
another
retailer outside germany, like FPC in sweden, when it will be more
expensive
for me? As I get the german version from FPC any way I better buy the
software directly from you, if I order 2 or more applications.

Hmmmm.. so this poweruser thing only works when I buy a new software,
and
not updates.

Here is one "funny" thing. If I'm a power user I wioll only pay 49DM
for a new copy of CAB. If I upgrade from 2.0 to 2.6 I will pay 49DM
as well, so I'm basicly paying for a new copy becuase to be able to
update I must already be a poweruser. Cool.

So if I wait and only "update" every second update of CAB I will
save _alot_ of money.

Upgrade every time for 2 upgrades: 39DM+39DM = 78DM.
Buy a _new_ copy of CAB as a power user every second time CAB gets
updated (I'm already a poweruser): 49DM

That will save me 30DM.

:-)

I hope people wont read this. ;-)

And most of you are Powerusers if you have got a copy of CAB.
But it will cost you 20DM to ship it if yo don't live in germany
but in europe. I guess they have set this to 20DM so that most
people will buy it from their local retailer, but if you buy
2 apps it will be cheaper to buy it from ASH directly.

I guess he isn't confusing things. The last time I used Linux on my falcon it has to be equipped with a MC68881 or MC68882. Nevertheless Linux doesn't run on machines without a pmmu, too. So, don't expect a standard MSTE with MC68881 to run linux.

> with a PMMU (paged memory management unit). It's the latter that's required
> for Linux (like any Unix). It's built into the 68030, but the 68020 needs the

So the version of Linux I tested required both "chips" a mathematical coprocessor and a PMMU.

I think it is sometimes forgotten that the vast majority of Atari programmers and people like ourselves at Atari Computing are just Atari enthusiasts. Constructive feedback and criticism is always welcome, but just knocking and moaning will piss most people off pretty quick!

The fact that there are still programmers writing such good stuff for our machines is always a surprise for me! Support and encourage these people, and all the others that are actively helping the scene is the message that should be getting out if you ask me!

Hi

I just sold my LQ400 after 7 years of service with my ST's and Falcon. It was a brilliant printer and has gone to a nice home with another Atari user. There were always lots of drivers available for this model for all sorts of programs. A truly well-supported printer.

And now I will cry because I miss my old LQ400 :-(((

There is an English version of CAB available. But even if there're
much more people speaking English, only a small number of the English
version of CAB is sold compared to the German version.

This is not very strange at all. If you buy CAB in sweden, norway,
denmark,
finland, france , spain, italy etc. etc. you will get the german
version.

Then you download the translated resource file in these languages, but
ASH
will still just see how many german copies that were sold.

Then there is the problem with System Solution. SS is _always_ a few
months behind the german release until they get their act together and
translate it. I bet that even most people in the UK and US gets the
german version as they doesn't want to wait 3-4 months until a english
release
is out.

If ASH hired someone like Mille we would see translated versions within
weeks
after the german, if not days. I bet that he would do it if the asked
and gave
him a free copy of the software he translate if ASH can't do the
translation
them self.

The same goes for MagiC and Texel and then we have a dozen more
aplications
that doesn't get translated at all.

I wonder how long it will take until the Emaler or Texel 2 is released
in
english. Not to talk about Papillion.

The MicroTek E3 & E6 are two scanners which are supported by the new ScanX-
driver. You can install it as GDPS and you can also use it as an ACC or APP.
But note it's a commercial product. The cost in Germany is DM 79.--.
As you live in Belgium there should be no probs in using a German dealer.

What about currency conversion, and, do they carry the English language version at ASH? How much longer does it take for things to ship overseas?

No, the Poweruser feature is practically useless to international customers. Oliver is in this _international_ newsgroup using that price to try to say the prices aren't that high, but it isn't fair to use the poweruser price as we can't really profit from it on this side of the pond.

On the other hand, I'm not trying to get on the "jump on ASH" bandwagon. I want the software too badly to want to do anything to alienate them.

I wonder, do their new FTP and E-Mail programs work with stacks other than their proprieatry I-Connect? If they worked with peter's STiNG, I might be interested in the E-Mailer if it was really good. Especially if they add newsgroups at some point.

Meanwhile, I'll keep my eyes on Newsie, the Draconis stuff, WEN Suite, and the stuff on Peter's STiNG page.

-----BEGIN PGP SIGNED MESSAGE-----

Linux/m68k is the port of Linux, a UNIX-like operating system
distributed under the terms of the Free Software Foundation's GNU
General Public License, to computers using the Motorola 68020, 68030,
68040 and 68060 CPUs. Current releases support Amiga, Atari and
Motorola VME systems (MVME 147, 162, 166 and 167); porting efforts are
underway to the Apple Macintosh and various 680x0-based workstations
(at present, the HP 9000/300 series, HP/Apollo Domain series, NeXT and
Sun 3 series). Efforts to port Linux/m68k to other 680x0-based
systems are also encouraged.

The current, complete FAQ is available on the World Wide Web at:

http://www.clark.net/pub/lawrencc/linux/faq/faq.html (Master site)
http://ftp.uni-erlangen.de/pub/Linux/LOCAL/680x0/FAQ/faq.html
http://amiga.nvg.ntnu.no/linux/mirrors/lawrencc/faq/faq.html

Conversions of the FAQ into various formats (plain text, PostScript
and DVI) are available at:

ftp://ftp.clark.net/pub/lawrencc/linux/faq/
ftp://ftp.uni-erlangen.de/pub/Linux/LOCAL/680x0/FAQ/
ftp://tsx-11.mit.edu/pub/linux/680x0/FAQ/ (and all tsx-11 mirrors)

The plain text version of the FAQ can also be found at all Linux/m68k
FTP sites and mirrors as "FAQ" or "FAQ.gz" (compressed with GNU gzip).

Christian Jacolot a traduit le FAQ en francais. On peut le retrouver
a: http://web.cnam.fr/Comp/Atari/Linux68k/Faq/

More information about Linux is available on the Internet at
http://www.linux.org/; the Linux/m68k Home Page is at
http://www.clark.net/pub/lawrencc/linux/index.html

Someone said CBHD will also do background DMA. I have no idea,
though. In any case, as I said before, that's a driver limitation,
not a MagiC limitation.

>I haven't noticed anything like that with my STE. When does it occur? Is it
>when reading from floppies, a hard disc, or both? Do you have pre-emptive

It's always been from hard disc (I never tried it with floppies).
Sometimes it happens during the boot process (after the AUTO folder
loads), and sometimes while reading something from disc later.

>multitasking on, and what are the timeslice settings? I've set mine to 20ms
>and 1:32, and it seems quite comfortable like that. It even seems quicker
>doing 3 things at once, than TOS did doing one thing at a time.

I have it turned off in MAGX.INF, but turned on in the CPX. I'm
using 10ms and 1:32. That's a holdover from my Falcon, though. I'll
try it at 20ms and see how that works.

I recently dug my ST out of the closet and wanted to run "Falcon" on it.
The software is installed on a partition of my hard drive, but won't run
from there. I can't remember what has to be done to make it run from a hard
drive -- can anybody clue me in?

I pickup a 520STFM with TOS 1.02 in spring 1988. Soon after 720K drives
were installed and Atari Canada would update your internal 360k drive for
roughly $300.00cdn at the time. I believe these would be the last of
the 360K drives.
Curious as to why you would want to know? I remember upgrading my 520sts
disk drive so that I could play Leisure Suit Larry TWO only to find out that
it wasn't that fun:-).
>.

Now I have multiple STs and would like to upgrade some of my SF354s to 1.44
as DSDD floppies are very difficult to find here. Um, could someone direct
me to the FAQs? I know that some people had success with the original flopppy
controller, and I think I want to test that way first.

thnks brian.

I don't believe the original author is dealing with TOS in Ram. IT is no
different than your 512kSTe. TOS in ram would be rare. He has a 520ST
TOS in rom. I don't use the cookie jar in my ST, I don't even know what it
is, and I have a 1040STe too:-). I am serious. HS modem and STing work fine
also, disregard my earlier message about STings statistics locking up, it only
happened the first time I used it , and I could have been looged off at the
time? STings Stats works fine. There are quirks with TOS 1.0, mainly being
2 bombs for some programs like, Cab FTP, and other clients in Cab. I really
cruise around on the net and am very shocked at how solid my 12year old ST
is. Especially since I just started using some of my friends pentiums and
have come to the conclusions that daily crashes are a common occurrence on
their systems too, when using internet programs. I never knew this before.

An STe is an excellent choice. However with the STe are a new host of bugs.
I have one that corrupts my hardrive and was defective from purchase new in
1989. If I have been correctly advised, it is a DMA problem, that existed with
a certain production model. I'd love to use my STe if it didn't corrupt
my SH204 HD.

Howdy Jim,

What's up? Has your buddy, Clayton Murray, got STinG running on aa.net?
I waited to see if anyone would respond to your message. Basically,
STinG/slip/ppp will setup easily and work well, or you'll have all sorts
of problems. These are almost always ISP related and there isn't much
you can do about it. If your logon is OK and you can ping your DNS, you
should be OK as far as your setup goes. You might try Resolve and Tracer
Route as well as ping. Did you try I-Connect that came with CABv2.5 or
do you have a slip only account? I assume you are using STiK to post
this message. Peter has posted that he will release a new Serial.stx
that might help as well. Good luck :)

CU,

Charles

>Any 33.6k modem will get those kinds of speeds (and higher).

Depending on what I'm doing and when I'm online I can reach speeds far
beyond 2700 cps and this with a 28.8k modem.
e.g. -retrieving e-mail up to 6000 but most of the time 3.200
-with cab 2.50 most of the time 2.800-3.000, sometimes I see
14.000 and above.
-downloading files: 2.800
-uploading files: 2.800-3.500

OTOH: The speed can as low as 300

>Anybody tested CAB >= 2.5 with Sting ? How do you make it work ?

Not only 'tested', I use this combo. all the time.

You just need to substitute Dan Ackerman's CAB.OVL for the one
provided (for I-Connect) with the package.

4579. Emulators ! The benches...

Newsgroup: comp.sys.atari.st
Date: 1997-12-20 00:00:00 UTC
From: Thierry Schembri <schembri@imaginet.fr>
Message-ID: <67gld1$sn3$1@belzebul.imaginet.fr>
Source record: 111401

I've made benches on all atari ST emulators I've found with GEMBENCH, here
are the results.
I've done these benches on my PC : Cyrix 686 166 mhz, 48 Mb, ATI Mach 64,
Direct X 3.0, Windows 95.
Graphic mode : 1024 x 768, 65535 colors
The reference machine is an Atari ST without blitter.

Winston is freeware and under development
Pacifist is "giftware"
StonxDOS is freeware
TOSBOX is freeware
TOS2WIN is a commercial product
Gemulator is a commercial product
MagicPC is a commercial product

Here are the results

Winston runs under Windows 95 and Windows NT
It is a very very early version, it can use only
TOS 1.0 and emulates (very slowly) only few
GEM applications. It can be used in fullscreen mode
only in 320x200x16.

WINSTON 0.0005
Resolution : 640 x 200 x 4
TOS 1.00
Win95 Window
Too slow, Gembench can't compute such slow results ! everything is 0% !!!

TOSBOX runs under DOS and can't be used in a
Win95 window. It can use only Atari ST standard
resolutions and colors.
It needs a TOS image and is designed to run GEM
application.
Information : www.tosbox.fatal-design.com

TOSBOX 1.0
Resolution : 640 x 200 x 4

TOS 2.06
FULLSCREEN

Gem Dialog Box : 298 %
VDI Text : 289 %
VDI Text Effects : 285 %
VDI Small Text : 218 %
VDI Graphics : 414 %
GEM Window : 344 %
Integer Division : 2901 %
Float Math : 591 %
RAM Access : 697 %
ROM Access : 678 %
Blitting : 498 %
VDI Scroll : 341 %
Justified Text : 315 %
VDI Enquire : 296 %

Display : 329 %
CPU : 1216 %
Average : 583 %

TOS2WIN is a german software.
TOS2WIN needs no TOS, the authors have rewritten GEM routines
and replace them with windows routines, it is very very very
fast (far from the others), it is very well integrated with Windows,
it uses its mouse and standard Win95 windows, it doesn't emulate
an Atari (no TOS, no desktop) but allows to use Atari (GEM) Applications
in the same way than Win95 applications.
It uses the most colors available you can use Atari applications
with 256 colors in high resolution without any problem !
It can't run in fullscreen
Information : www.aixit.com (german)

TOS2WIN 95 1.19
Resolution : 640 x 400 x 256
No TOS
Windows only

Gem Dialog Box : 505 %
VDI Text : 5256 %
VDI Text Effects : 2611 %
VDI Small Text : 6039 %
VDI Graphics : 1791 %
GEM Window : 752 %

VDI Enquire : 915 %

Display : 2116 %
CPU : 1676 %
Average : 1991 %

GEMULATOR is a commercial product.
It needs an ISA card with TOS inside.
This version uses DirectX but it is not the latest one.
Version 5.0 will be soon available.
You can choose high resolutions, but didn't found how use more than 16
colors
It can run in Win95 windows or in fullscreen.
It is a good product but less integrated in window and slower than TOS2WIN
It doesn't use the Win95 mouse (you have to switch mouse mode to move
the window).
It can be used with Magic ST instead of the TOS (for laptop computers)

Notice that Gemulator can emulate atari TT, STe and Macintosh (up to IIcx)
too.
But, I've tried to use the stereo soundchip of the STe but it never works
:-(

information : www.emulators.com

GEMULATOR 4.8
Resolution : 640 x 200 x 4
TOS : 2.06

Pacifist is a french software.
It is the best Atari ST emulator, a lot of demos and games work perfectly
without
any problem.
Don't use the 0.47 version, it is a very slow and unusable version.
The best version is the 0.47 beta 1
This emulator was designed to run demos and games, it runs under DOS in
fullscreen
and can't be used in Win95 window, it can't use high resolution or colors
and
is not recommended to use with GEM applications.
It needs a TOS image
Information : www.pacifist.fatal-design.com

STONXDOS is the adaptation for MSDOS of STONX, the ST emulator for
XWindows. A pretty good adaptation. It is rather fast, emulates
the blitter. It runs only in fullscreen under MSDOS.
It needs a TOS image

STONXDOS 0.4
Resolution : 640 x 200 x 2
TOS : 2.06
FULLSCREEN

Gem Dialog Box : 204 %
VDI Text : 194 %
VDI Text Effects : 200 %
VDI Small Text : 142 %
VDI Graphics : 305 %
GEM Window : 247 %
Integer Division : 2321 %
Float Math : 460 %
RAM Access : 347 %
ROM Access : 346 %
Blitting : 336 %

VDI Enquire : 193 %

Display : 225 %
CPU : 868 %
Average : 409 %

MagicPC is a german software
It needs no TOS, it simulates an Atari with a multitasking operating

system, it uses high resolution and colors, it is a good product
but can run only GEM application. It is a bit expensive.
It can be used in Win95 window or fullscreen.

MAGIC PC DEMO VERSION 1.20
Resolution : 640 x 200 x 4
No TOS
Win95 Window

Gem Dialog Box : 1190 %
VDI Text : 701 %
VDI Text Effects : 707 %
VDI Small Text : 384 %
VDI Graphics : 277 %
GEM Window : 118 %

Complain to the posters isp.. thats usual postmaster@wherever or
abuse@wherever i get a reasonable response rate, most say they have
warned the poster, some say they have banned the customer, and one isp
said they believe in free speech and will do nothing :(.. but like i
say.. most get them stopped

But a lot of SPAM as its called is sent in such a way that its damm
near impossible to trace who sent it..

One thing not to do is to post to the sender yourself, sometimes
people post SPAM knowing it will annoy, but use someone elses
addresss, either someone at random or soemone they dont like, so dont
post nasty messages to the sender as it may not be them..

>And while were at it, I get this crap in my mail, can this be STOPPED?

a lot of spam is generated from a massive list of live emails, you can
get yourself OFF this list by going to this web page

http://www.iemmc.org/remove.htm

you give them your email and they then email you to varify you want
off the list (believe it or not some people WANT these spam you see)
you then go back and get yourself off the list

Unfortunatly the next time you post to a public newsgroup and your
email is subject to being lifted and put back on the list..:(
ading such things as NOSPAM doesnt work..

>Who's in control?

hehehehehe... sorry for laughing..hehehe... the simple answer is NO
ONE.. hence the confusion and chaos... hence the pirates and porn
merchants, the get rich quick and the total nutcases... there all
here, no one is in control...

However there are people who think they are in control.. the wannabe
moderators who are convinced they know whats best for everyone ... but
you get used to there "better than you attitude" after a while :))

HTH? :)

Ot would seem to me that a well written program (OS) such as Magic would be able to continue to run despite the failure (crash) of a sub program running. This feature alone is a valueof the OS. So the answer to your question >Do you claim that these programs are OK and it is MagiC's fault? I would think that it is both the programs and magic fault.
1. Why do they release a buggy program in the first place?
2. Why can't Magic as an OS handle the failure of one program while running the other?

>who is selling TOS 6.0 and what are it benefits compared to OS' like THING
and some of the other alternative desktops?

Actually The Thing and alternative desktops are not an OS at all. They are just
that an "alternative desktop" to the one found in the TOS. These desktop do not
really change the TOS but mearly add missing features or changes the way the
desktop looks on the screen. The functions that these alternative desktops use
are still basic calls made through TOS.

>My setup. MegaSTE 4mb, NVDI 3.01, STing ppp, CAB 2.0.

Hi George

The problem you mention is part because of the conversion tables that NVDI uses and part of the "reverse" transation CAB does in order to conform with the iso character sets. Although this scheme works ok for iso-8859-1, also known as Latin-1, the same is not true for the greek character set iso-8859-7.

The solution I have found is two patches, one for NVDI and one for CAB, that simply cancel any character translation. This is not a problem for greek users since Atari never established an official greek character set. After all the adopted standard of the MSDOS greek codepage is dead anyway, so the change won't hurt you.

I'll send the two patches by mail, but I post this answer just in case someone else is at a similar condition.

I have a lot of software that I no longer use--some won't run on a Falcon; some I am tired of; and some I never liked in the first place. It is in a box and is yours for the price of postage--say, $10. (If you live in the DC area, just come by and pick it up.) The box will include at least the following (I am still going through my stuff): numerous disks from mags; Fast Basic; Warp 9; ChessMaster 2000; G+plus; The Assembly Language Workshop (book & disk); DEGAS Elite; Hot Wire; MultiDesk Delux; Word Writer ST; WizKid; Maniac Mansion; Monkey Island; Epic; Lemmings. All are legal copies, and all include disk and manual.

I also have an SC1224 that I no longer use. It's yours for $20 plus postage.

John

>Why don't you want to use the CPXs ?

I'm probably just lazy, but I find it awkward to first have to run the
cpx's and activate Sting, and then activate it again in the dialler.
(I'm running Cops as an app from the desktop). Sometimes I even forget
about the cpx's with not very good results... ;-)
That's why I like Stik's concept better - port speed set via the
default.cfg file and the rest through the dialler.

Why don't you just save STinG as active in the CPX, and then you
don't have to activate it each time? That's what I do, and I never
have to mess with the CPX.

Mind, you DON'T save the Port CPX as active. I'm talking about the
Internals CPX.

And this doesn't bother Semper, my Fido front-end mailer, as long as
I don't have the Dialer active.

Hi all!

This tree will be one of the largest this year here at sys.atari.
Think this coversation wouldn't be so dramatical if people just tried out
what CAB 2.6 and Fiffi is capable to do, with little help
from the jinnee desktop, and certainly by PPP-Connect.
The functions is stunning, the Drag&Drop possibilities between CAB and
Fiffi-windows and the apps on the desktop gives a new
dimension to access the Internet. The use of GEMScript with CAB 2.6 lets the
supporting apps to cooperate and share each others functions in a way you
can't find elsewhere.
Fiffi uses threads to cope with the command- and filetransfer ports (e.g
MagiC 4/5). This is a true pre-emptive multitasking.
I have not seen many apps for The Atari platform that uses threads. There's
people too who says that threads on a MiNT-based or MagiC operating system
is fake and never can be compared with real threads. I don't know.

But I agree in that fact that ASH apps seems to get more and more integrated
with each other. They sertainly is enhanced to each
other, good or bad? I don't know, but they sertainly is "killer" apps.

Not to forget, we have to wait and see what TOS 6 and the new N.AES is
capable to do.

Is in there. Unfortunately the link is in uppercase (CAB_OVL.LZH). You need
to convert in lowercase (cab_ovl.lzh)...

>Dunno, but why on earth would you like to use it on a Falcon???

If you mean can the sampling cart work with a Falcon, then I must say
that I highly doubt it. I'm not sure how well ST carts work with Falcons
even though they both use the same type of port...but since the Falcon has
a built in sampling port, this is very moot point. So you'll still need a
Falcon program to record samples.

However, I suppose the program itself can work if mainly for playback and
cut-and-pasting. Can't see why not considering it was made for STe's. It
would be fine for stereo samples, but if you're mostly working with mono
samples then I recommend Sound Lab instead.

Iï¿½m currently writing a program that aims to
devolop your ability to hear and define intervals.

Since the only programming tool I have is GFA-basic, and thats
also the only language I know how to use, thatï¿½s the one I work with.

Now to my question(s):

-Where can I find some _good_ documentation on how to use
GEM/AES from GFA-Basic..?

-How do I get Flying Dialogs 4.9 to work? (Nukes me every time!)

-Are there still people using GFA..?

/Joakim

There is-was a card from the U.K. that does-did cause problems on the
Falcon using 30 pin simms. I have a Gizmo with 4-4mb 60ns 30 pin simms
on my Falcon with a Mighty Sonic and Nemesis and it works without
problem. Which card did you have?

To do multitasking I ended up with the choice between Magic and Geneva. I eventually chose Magic. I'd had several attempts to install MiNT and failed with all but one attempt, and that was v0.95b. After an admittedly short time trying to make it work, I gave up on it and chose a commercial package that gave me almost all of what I wanted.

> Not very thoroughly it appears to me :

After a second look I've had another, much more thorough, check to verify my figures and they
are incorrect. Serves me right for relying on Magic to say how much memory
was free. All the new checks were done using a program that shows the memory
available to start an app in, ie. it works out the space between the start
of the basepage, and where TOS initializes the stack-pointer. This, I think,
is about the most accurate way of taking measurements.

> > STiNG 200Kb This is with the memory set to 60000 bytes

I stand corrected on this. I forgot to disable Xcontrol before checking the
memory used. :(

> > XCONTROL 67Kb v1.31 with just the 3 STiNG CPXs enabled.
>

That's the first time I've heard that Xcontrol can work as an application as
well as a accessory. As this can be done, then the memory used here can be
ignored.

> > DIALER 113Kb
>
> This cannot be counted either, as you can terminate the Dialer after the

> is alright, though.

At least I can get something right :)

> You forgot one thing though, which is HSMODEM, which is required with such
> old machines. It takes about 15 KB.

That was something I hadn't included, even though I should have remembered
to do so. I still seem to need it with Magic v5.11. That depends on the
input/output buffer sizes. If you stick to 256 bytes for each, the size if
less than 10Kb. Since most people would use much more than this, 15Kb is
probably a good value to use.

> The above is all that is needed to set STinG up and establish the connection.
> As XControl and Dialer can be started one after the other, the total memory
> need up to now is 135 KB + 15 KB + 113 KB = 263 KB, which is probably small
> enough that it'd go even into a machine that runs TOS from RAM. After termina-
> ting the Dialer, only 135 KB + 15 KB = 150 KB stay resident.

The trouble with having TOS in RAM is that when the machine has only 512Kb
to start with, there's less than 240Kb free. That's what was left after
setting my spare STE to 512Kb and loading the disc version of TOS 1.00. On
top of this, a cookie jar needs to be installed otherwise there are some
problems with HSmodem and STiNG.

> So even if the NEWSie/POPwatch/NewsWatch figures are right, you cannot really
> call it tight on one MB systems if TOS is in ROM. I agree it's tight if TOS
> works from RAM, though. And NewsWatch at least should easily work even on a
> 512 KB system.

With only 240Kb free, the memory required for the STiNG and HSmodem means
that there would only be 90Kb free when you get to desktop. And since the
dialer needs 113Kb, you can't use that to make the initial connection. As
well as that, neither POPWatch nor NWatch have enough memory left to be
started.

> > The best thing could be done was to see if an STE can be found cheap, and

> it's just as good.

Any ST with 1Mb or more would be the minimum to use, even if the machine
didn't have TOS in ROM (are there 1040s without TOS in ROM?). I still say
an STE would be a better choice if there was a choice, just because the
memory is much easily upgraded to 2 or 4Mb.

It hasn't done so with me, not yet anyway. What version and settings are
you using? I use v1.15 with the following settings:

Correct errors on
Print errors off
Physical check on, 1 retry

Cut-off at 0 entry on
Split overlapping on
Remove illegal chars off This probably kills the long filenames.

>
> In what way is Correct's physical check better?

So far, HP_OPT doesn't seem to mark bad sectors. Correct does.

Since when was it normal for people to buy direct from the publisher/developer? There are some companies still seeling old computer came and there are Atari owners selling 2nd hand games, you hurt them.

> Look, I think that you are the ones with the problem - the problem is
> that your virtue takes no account of reality.

The reality is that the stuff you wish to distribute is protected by copyright law be there a commercial market or not. Distributing pirated software is a serious offence.

Mine is the same, except I have Physical check off. (And yes, I have
Remove illegal chars off.)

Correct will tell me I have illegal directories, illegal file size,
lost clusters, that sort of thing. And when I have it fix these
problems, I lose my long filenames and my partition name. Optimize
does not do this. (That is, Optimize has yet to find a problem.)

He Kellis and others,
First of all the problem seems to be solved. I was using the
proxy servers of my provider and these caused (?) the initial problem.
Without the proxies the mint overlay works very well.

>
>Please, do not use multistrip, (nothing to do with the subject btw),

Second, this can well be true as I can't use the excellent
screensaver "Twilight" with the multistrip. I have TASKBAR from "Jo
Even Skarstein" somewhere on my harddisk so I will give it a try
right away.
Just did and I must admit it looks very nice indeed. I'm missing
however that nice clock of Multistrip.

I use STinG with CAB 2.5 everyday. As for "how do you make it work," that's a pretty broad question. Basically, if you already have STinG working, all you have to do is make sure you're using a STiK compatible CAB.OVL instead of the one that comes with CAB 2.5. It's basically just plug-n-play, no different than earlier versions of CAB.

What program do you use to check the memory a program uses? I am
interested in this. Certainly is easier than my trial an error method.
Luckily I have an abundance of old 520STs in various configurations to
check things with.
>
>> XCONTROL 67Kb v1.31 with just the 3 STiNG CPXs enabled.
>

>

I never knew you could do this with the Xcontrol panel. Hey I just got it
a few weeks ago:-). This will help out 512k machines alot.

The possibility of a functional 520ST on the net seems quite reasonable given
these numbers.

>Whew that's quite a lot. I didn't know that. Doesn't NEWSie use dynamic memory
>management ? John, are you there ?

If NEWsie could work on the 520, this would be excellent. There are more
520STs out there than any other Atari 16bit and up. I am not sure if they are
still being used or what? I felt in back 1987 that 512k was barely enough
to do anything productive. However they are cheap, and easy to get hold of.

Many former and current Atari users are experiencing the internet on other
platforms, ok , on windows, and if they could get on the internet with their
old computers it could save someone $ to update to a new platform just to
become internet able. While it may be easy for one to say that it is cheaper
to update an ST with ram and HD, or even get a used falcon or TT, these options
do not seem easy to someone, who is isolated, and isn't current on the inter
net. Once online, locating hardware software etc. seems a little easier.
Therefore I think the whole atari user base could benefit from seeing 512k
machines on the net. After they are online, then the updates will follow.
Heck, I've got the bug real bad now;-)

>512 KB system.

There you have it. If I have read things correctly the original author should
be able to get what he wants out of 512k. And perhaps an earlier version of
Newsie might not require as much memory? Or perhaps a Newsie light version:-)
Gee, did I say I really like NEWsie:-). One other thing, is that if Newsie
did work within 512k, all editing would probably have to be done outside
of NEWsie, as I couldn't see there being anyroom left to launch an editor
from within Newsie. However, I do have an editor from a coverdisc mag
that uses only 12k and works quite well.

>not make any difference, if it's a 1040 ST or 520ST+ (one MB) with TOS 1.4
>it's just as good.
>
That's correct, and updating the TOS will help ALOT. However, for the time
being, I have been able to have a fair amount of success with my TOS 1.0
machine, And I am able and willing to compare notes with other TOS 1 users.
And memory should be done, get lots, or even better find a used
one with the memory already upgraded.

Oh yeah, anybody else have STing dialer lock up when after checking the
statistical information with version 1.12? It didn't happen to me with version
1.10 however, maybe 1.12 isn't as tos 1.0 friendly:-) Anyways, the new
dialer is so much better I can live without the stats.

4622. Atari items for sale

Newsgroup: comp.sys.atari.st
Date: 1997-12-21 00:00:00 UTC
From: Scott Boesken <scottboesken@harborcom.net>
Message-ID: <349CDCFF.1981@harborcom.net>
Source record: 111288

Atari items for sale: For the ST family. 8 bit stuff at bottom of
list.

1. Actual Atari mouse with Atari logo on it.Two buttons and a DB9
connector.

2. Stereo Master for the ST & STE. by Microdeal. Has a cartridge port
input box,software and cable. Comes in like new condition in the box
with
all paper work and user manual copyright 1991. Real time digital sound
effects
and will interface with a external MIDI keyboard. Plays frequencies
from
3.0 to 28 Khz in ST mode and 6,12 and 25 Khz in STE mode.Pretty cool.
Like new.

3. PageStream V1.8 This a earlier version of PageStream. Comes
complete
with 2 floppy disks, a three ringed binder manual and a printed box to
hold
everything. This is one heck of a desktop pudlisher program. Good
condition.

4. Golden Image Deluxe Paint with animation. Comes with 3 disks and
manual.
The program does graphics, fonts, animation, printing and the whole
shabang.
Serious graphics program. Like new and alot of fun.

5. Zany Golf. 2 disk program. It's miniature golf on the Atari. What
a
hoot this game is. Very realistic action. Mouse driven with very good
graphics.

6. A three volume set of Atari ST and megaST books by Ralph C.Turner
The books cover the basics to advanced levels of knowledge and use.
A must read set of books for new users. This is the Atari manual you
never read.
Very good books in very good condition.

7. Falcon: The F-16 Fighter Simulation by Spectrum Holobyte. Atari
ST/Amiga
version Comes with a large user manual, 2 floppy disks and a code wheel.
Excellent fighter sim.

8 bit stuff:
1. Atari 800 computer with BASIC XL catridge. It has 3- 16 K modules

and 1- 10 K memory module. What do you need that much memory for?
2 cartridge slots, and my favorite, 4 (joystick) DB-9 ports. The Basic XL
cartridge comes with manual. Computer comes with transfomer and printed
computer cover. Ready to go, very good condition. Just add a television
and floppy drive. Which reminds me.

2. Atari 8-bit 1050 floppy drive. This 5.25 external (get it?) floppy drive
in the original box and ready to go. Very low hours on the drive which
is in excellent condition. My friends brought me up to 16- bit ST very quickly,
hence the low hours on this drive.

Submit your offer, as sig members requested, to me e-mail only.
Most items can be shipped very cheap. Hardware is a bit more.
Shipping is paid by the purchaser.
I need to get these items out of here and I would like them to be put to good use!
I have posted this add in the past and have many renigs. If you want to buy,
I will sell. I am in Ohio, U.S.A. for shipping concerns.
My e-mail address again is scottboesken@harborcom.net

It's bad enough that you keep posting this huge binary, but if you're
going to tie-up peoples' connections, you may as well do it with an
efficient JPEG (i.e., not the 99% 'hog' you've used multiple times).

Better yet, why not just announce the CD and then have a WWW link to it.
If you can create a CD-ROM, surely you can create a Web page.

Making people angry isn't going to help sales.

I have my mail software set not to download anything over 200 lines long because theres always some fool posting binaries.. I don't want to have to pay the extra cost of downloading useless stuff,

You see we have to pay by the second here in the UK

So can I just check.. did I miss anything interesting in this 900+ line post ?

thank you :)

>I managed to get my copy to work after a while. the only thing which
>doesn't work now is the online help, but I don't really care as long as I

The secret (for me) was to specify the help directory in the environment
path (this sample for MagiC):

#_ENV GS_LIB=h:\gs353b,h:\gs353b\ps,j:\postscrp
#_ENV GS_HELPDIR=h:\gs353b\help

Although I still cannot get the help window to display if I set it to
display the PostScript version of the help files! :-)

>The links to the stuff you need are as follows (in case nothing has changed
>since I last checked):

Beware that some of the sites linked to don't have the latest versions of
the archive.

An English manual is being prepared by a member of the TransAction team.

I've gone back to Extendos since I cannot get Spin to access audio or video CDs, despite the loss of long filename support (and b/ground DMA, although I don't use it).

I thought the Atari ST was seriously obsolete, and i guess i am right.
It never could quite cut it, could it, against the old Amiga.
I won't give too much shit about Atari as being second best in the home computer stakes at the time was pretty good.
Heard about the PPC developments for Amiga 2000 and up???.
Not trying to start a flame war but Quake is about to be released for Amiga and Myst already has been. I know it a bit late but at least it does show how versatile an operating system AmigaOS is. Can't see an Atari port in the near future.
Is Atari ST technology still being developed? (serious question!)
Is there a future?

The Atari is dead, let it be.

PC user,
BH

>
>Strangely enough quite a few people actually use STinG with MiNT, so it
>can't be that hard, can it ?
>
>Have you checked the DIAL.INF file ?

I have now; it was in the dialer folder, I put it in the root
directory and now the dialer loads fine. I've discovered an oddity
though:

Under Mint the DIAL.INF file needs to be in the root directory, BUT

Under singletos it doesn't matter, in fact if DIAL.INF is in the
root directory STing doesn't work. I have to remove it and reboot to
get STing to work.

****

Anyway back to business... the dialer is now working ok under Mint. The
serial CPX wouldn't work for a while, but now I run HSMODEM after
Mint so now that seems ok BUT...

After dialing and connecting STing remains on "initialising link"
until the timeout. The IP address never shows up in the dialog box
and eventually the computer crashes when something does arrive at
the modem (don't know what it is 'cos the computer crashes).

Can anybody help? I seem to be getting a bit further each time so
thank for the help so far.

I'll change this thread to STing and Mint next time as that's more
appropiate.

Cheers! Simon:-)

It is a known fact that all Atari users have Jaguars. We already have
Mist, and AVP is better than Quake any night.

>I know it a bit late but at least it does show
>how versatile an operating system AmigaOS is. Can't see an Atari port in
>the near future.

Port of what? Assuming you mean Quake, I feel that it just goes to
show your immaturity toward computing. What type of compairson is
Quake to MiNT or Linux? The Atari operating system is on a chip inside
the computer. It is available there if users should decide to operate
their system with that O/S, but this does not demand its presence. It
is far more easier for a beginner to boot and Atari than it is for an
Amiga user to boot his machine without a hard disk or O/S on floppy.

I think this is the wrong newsgroup. Go to the *.advocacy areas. BTW
starting a flame war between two computer systems that are not supported
by the original manufacturers and fight for survival, is not a very
productive idea.

On the issue concerning the development of the OS. In contrast to the
Amiga, ports of the reengineered Atarti OS are available for almost all
computer platforms. These operation system (Magic) cannot onyl run old
Atari software but it can also make use of the additional functionality,
such as 16.7 mil. colors, higher resolutions etc. of the hardware. Does
the Amiga OS actually now support resolution and graphic-processor
independent programming? Or do you still stick to this HAM and the other
bullshit graphic modes to have 4096 colors displayed at a time in 640*200
resolution?

Sorry, couldn't resist....;-)

Alfred

If you want to have the best Amiga ever released get a Nintendo!

: Rgds, Derryck

There must be something wrong with your audio CDs ! SPIN allows me to play
each track with the help of a little programm called TRACKxx.PRG. This
programm is seen when you open the CD's window as well as .WAV files of each
different tracks.
I have not tried Video CDs because I don't have any but I don't think they are
handled by SPIN.

4638. CAB OVL 12706

Newsgroup: comp.sys.atari.st
Date: 1997-12-21 00:00:00 UTC
From: shammond@loop.com
Message-ID: <67jter$r95$1@usenet85.supernews.com>
Source record: 111304

There is an update to CAB OVL - version 12706. You can get it at:

http://www.netset.com/~baldrick/cab_ovl.lzh (lower case - all)

Note: If you go to Dan's web page and click on CAB.OVL, you will get a
"file not found" error. The problen is that the file is listed as CAB_OVL.LZH
(upper case) in the page.

Dan mentions two things in the latest download and on his page.

1) The latest version of CAB.OVL has cookie support for the upcomming
release of CAB 2.7 - and no, he does not know when ASH is going to
release this version :)

2) STiK version II (2) is close and will have PPP support.

Regards,

Steve Hammond

He Clair,

Why don't you make use of the excellent "Currency Converter" of Mario
Becroft. According to this program 141 DM equals 48.96 UK pounds.
I don't know where you can find this utility. It came with the latest
"Atari Computing" readers floppy.
Maybe you can find it at Mario's homepage:

4645. Atari Falcon wanted in UK

Newsgroup: comp.sys.atari.st
Date: 1997-12-21 00:00:00 UTC
From: kris@kphil.demon.co.uk
Message-ID: <882738886.29759.0.nnrp-09.9e98de19@news.demon.co.uk>
Source record: 111311

Hi,

A friend is after an Atari Falcon in the UK.

Must have say 8 or more megs of RAM, but a hard drive or monitor
or software isn't important or needed.

Will pay around 100 UK Pounds for a base Falcon like this.

On another point, he's really into MIDI - and uses Cubase on
his ST - but does any version of cubase take advantage of
the extra falcon features like the DSP? How much better would
his MIDI be on a Falcon, what extra features would he have access
too?

Looking forward to hearing from you lot!

Kris.

It won't even allow MAF (Octopus BBS area and file manager) to access
my Crawly Crypt CD. And if I access it from the desktop, it takes
forever to open a directory. But the worst thing is I keep having to
turn off and back on my drive to avoid the "device not responding"
error at bootup.

So I'm back to ExtenDOS Pro as well.

Since a 2-Meg RAM upgrade to a 520ST is fairly
cheap these days, it sounds like the way to go.
If you've still got TOS 1.0, it might be worthwhile
to update to TOS 1.4 while the case is open.

Mike,

At least for true color modes, I think the reason you are getting the distorted screens and fonts is that the OS thinks it's in 40 column mode and scales things accordingly. The same thing happens with the Nemesis true color program and also Videlity.

Greg

Yes, in CONFIG.SYS. Example:

*DOS, c:\auto\hs-iso.dos -c128, S:A

Sets the cache to 128K.

Well, judging from where the majority of the software comes, I don't
agree.

But obviously there's no point in starting an argument about that.
If ASH wants to sell MagiC outside the German speaking countries,
they'd better make english programming documentation available (which
might be there already).

However I find it a bit silly that some people obviosly have a hard
time accepting that English is not alway the language #1.

When I've retrieved newsgroups online, and have the groups window open on top, and a single window open on the bottom for a particular newsgroup, and a window in the middle that overlaps these (for individual articles), then I have the problem. Lets say I've just read a message, and pick next msg., it will show about a 1/2 inch of my desktop in the lower part of each of the 2 bottom windows, and sometimes when I try to access a message it shows the group messages in the article window! Ugh. :(

HD Driver is a commercial program.

You cannot use a parallel port ZIP drive on an ST, because the ST's
parallel port is not capable.

Petter,

I completely agree. I was quite surprised to find that NEWSie does several things, and does them very well. Usually I find that multi-purpose programs are either lacking in ability or provide functions that I have no use for. NEWSie does the things I need it to do, and it does them very well.

Thanks John!

Llamazap by 16/32 Systems, is now only $5.00 shipping/handling.
In original packaging, includes
english/francais/nederlands/deutsch manual.
No warranty. All sales final.
Email for availability.

system requirements: any Falcon w/colour display (will not work in monochrome)
and a new Super Funky joypad.

Game Description: Llamazap is an action game of 25 stages in which you,
as a completely hard and unspeakably beweaponed llama, set out to
destroy alien hordes and protect innocent herbivores from molestation.
Usually you fly a spaceship over a bi-directionally scrolling planet,
but frequently you must leave the safety of your ship for tentacle-to-
hoof combat with your enemies. Your aim is to battle your way through
to defeat the last boss on the last level and thereby save the Galaxy
and make it a safer place for ungulates everywhere. Along the way you can
earn extra kudos by rescuing abducted livestock, saving the dolphins,
and rescuing lost and bewildered llamas.

Dunno what sort of nonsense you do in order to crash it. Sure, most OS
can be crashed, you just need to be evil enough. Even a Unix system is
down if you do
while (1) fork()
We're talking about sensible use of an OS.

> GEMDOS sources for TOS are dowloadable on the internet you would think

As a programmer you should know better, that any dirty things have the
potential to prevent working on other OS versions. Mind you : That can
even be a TOS version.

>> So by any sensible means Magic is pretty close to 100 % TOS compatible.
>
> It is, but it isn't 100%.

You're pretty stubborn aren't you. I had explained above that any two versions
can never be 100 % compatible

>> If you disagree, first give a sensible definition of "compatibility" that
>> leaves all TOS versions compatible, but not with MagiC.
>
> Not all, but as I said you do expect it to be compatible to the latest
> AES and GEMDOS versions released by Atari as it's an upgrade, or maybe
==========
AES 4.1 was never released to the public. It was a beta version that leaked
out of Atari.

> I missed that somewhere. There are _plenty_ of AES calls that MagiC
> doesn't
> support and insteed of comming up with new MagiC specific calls, why not
> try
> to make it AES 4.1 compatible first?

All the calls are there. But even if not, there is no real need to make it
compatible to a pirated beta.

> It wont make anyone happy if they
> doesn't foollow the "standard" which AES 4.1 is. When that is done they
> can play around doing whatever they want.

A pirated beta is a standard ? Are you advocating software piracy here ?

> 2. Why can't Magic as an OS handle the failure of one program while running the
> other?

It's simply a matter of what the program does. As memory protection does not exist on Ataris (not counting Linux68k) MagiC cannot protect itself against programs that overwrite system data structures. A simple bus error leave no trace under MagiC apart from the warning dialog, but it can already seriously derange TOS (which will be noticed only later). But no system can survive if programs write into the OS' data space.

Probably mainly because System Solutions is so slow. Or is it ASH being
so slow shipping the english versions to SS ?

I'd hesitate too buying the version 2.5 if you know from the newsgroups that
2.6 is out for a while already in germany and 2.7 is imminent.

Basically this is true. Only some ISPs that only work if you use Proxies (hate'em)
require ATM to fill the proxies into DEFAULT.CFG. But even this will be obsolete
with one of the next versions of the Dialer.

Ok, cool. Do you know of any way to trick the computer into thinking otherwise, so it doesn't do that? Thanks!

I would go with a Mac. I faced a similar choice last year and I have been very happy with the PowerMac. I am not all convinced that MagicMac is the way to go. I have it but do not use it. I would suggest looking at Nostalgia which looks very nice indeed and will let you use even games on the Mac. Protext is a good WP for RTF and Ascii files.

>The Atari is dead, let it be.

Pretty funny statement from a guy using a machine that doesn't go beyond 256 colours on a normal VGA-monitor, isn't it?

Let's face it, dear friend: Nobody in this f****** computer world is talking about the Atari or the Amiga anymore, right? That should be no reason for you to stop using your machine nor should it stop me to use my wonderful Falcon.
Go your own way and do it because you think you're doing the right thing. Get a little bit mature and stop waisting our time with the rebirth of a silly old war from the 80's.

If you want to have that kind of fun, go and put a few flames into a Win95 group.
Thanks, I hope I'll never hear from you again.

>his MIDI be on a Falcon, what extra features would he have access
>too?

Cubase Audio for Falcon would naturally be the next step for your friend.
It's a version especially for the Falcon and the advantages are huge.
The "normal" Cubase for ST's is a software-sequencer more or less, Cubase Audio is really great harddisc-recording system. Yes, it uses the DSP for effects for example.
I heard that CAF is really cheap at the moment, so your friend should hurry up.

Another good choice is the Audio Tracker from the German company SoundPool.
It is also a very professional hd-recording software for Falcons with a more modern user interface. He should download a demoversion from their homepage:
http://ourworld.compuserve.com/homepages/SoundPool

BTW: I highly doubt your friend will get a Falcon for 100 Pounds ...

STinG, for some of us, will not access PPP (using the latest SERIAL.STX). For me it is not a problem as my ISP has SLIP, CSLIP and PPP. The advantage is that it will be another stack. And it may very well connect with ISP's that STinG has problems. As far as a SLIP connection is concerned, I have never seen a difference between STinG and STiK as far as stability or speed on my system. A plus for STiK is the ease of set up. There are no CPX's to deal with. On the other hand, STinG does allow other types of connections (lan, etc) that for some might be important and currently has the best interface for those of us using a multitaking operating system.

The real important point is that without the efforts of Dan, Peter, John, Alexander and all the rest - we would not be having this discussion using our Atari computers.

I originally had a 520ST-M, which had no disk drive at all. (At the
time, I think it was cheaper to buy that and an external 720-drive than
the ST-FM with a built-in 360-drive.)

I've updated the Atari Reference Desk, and I'd appreciate some
comments, suggestions, or complaints so I can determine where to take
it from here. (URL in sig.)

Updated:

- 'Help' section is now available.
- Changes to the links. I've broken it into 'Quick Links' & 'Browse'
(Browse gives descriptions of sites)
- A couple of new files in the 'program reference library'
- Preliminary info on the ST+ Fanzine - mostly thoughts on price.
(Well, technically, this isn't part of the ARD, but...)

* Still looking for info in the 'whatever happened to...' section
* 'Atari Community Bulletin Board' will probably be available in
early January.

Thanks,

Terry

4702. FracIRC2

Newsgroup: comp.sys.atari.st
Date: 1997-12-22 00:00:00 UTC
From: outrider@anv.net
Message-ID: <67l3kn$479$1@usenet11.supernews.com>
Source record: 111342

I thought I'd check out IRC, so I downloaded FracIRC2 and thought I'd give it a try. Unfortunately, the docs make the assumption that you already pretty much know what you're doing and just need a program to do it with. However, I have absolutely no clue.

Fortunately, the program is pretty well laid out, and much of it is straightforward. A few things I'm not sure of, though...

What is the Port: setting for? Is that for your modem port or is it for something completely different?

When it asks for Hostname, is it asking for my domain (anv.net)?

What's it looking for under URL file:?

I found three server names on a Web page, which gave me something to play with, but couldn't get any of them to work. The three are:

irc.ccon.net #atari
irc.stealth.net #atari
irc.funet.fi #atari

I know that once you open connection you can then enter the channel (e.g. #atari), or at least that's the way I think it works. However, the first one above was unable to resolve, whereas the other two timed out while opening connection. So I feel I'm close.

Are there any other servers/channels, that make a good place to practice?

Thanks and Happy Holidays!

Hi,

>
> Is it possible to create a network between an Atari 1040 ST and a PC running
> windows95/dos
>
> Roy Benjamin Coert
> elroy@worldonline.nl

Yes this is possible, but how you achieve this depends
on what you want to do.

If you simply want to access the PC's hard drive from your
ST you can use a program called Ghostlink. This is a dos
utiltity that allows you to map PC drives onto your Atari.

Unless the program has changed since I used it some time ago,
Ghostlink only allows you to read and write data files to
the PC drives, so you will not be able to directly run programs
from the Network.

Another way would be to setup NFS (Network File System) on both
machines. This is quite a complicated task, but worth it in
the end. This method does require a lot of resources and so
will be quite slow on a normal ST and will require a Hard Disk.

You will find details of this method on my Home Page. My Home
Page is a little untidy at the moment, but all the info is
there.

Regards,

Ben Hills.

Tony Cianfaglione wrote:

> Is the Zip driver HDDriver6 available on any FTP site?

HDDRIVER is a commercial product. The demo version of HDDRIVER 7.1 is
available from http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html
or via anonymous ftp: acp5.chemie.uni-kl/de/pub/atari.

>How would I hook a parallel port Zip drive to an ST?

You need a special adapter (price is about 150 DM) for this. Use the
SCSI version, this is much faster.

Message-ID: <01bd0eab$792b01a0$LocalHost@rambler.ic.new-ulm.mn.us>
Source record: 111346

Nope. Just a picture of a black & blue CD that says 'ATARI' on it. Kind of
a waste of my time downloading it. Twice, because I wasn't paying attention
the second time I grabbed the second posting... The CD may or may not be
worthwhile, but kind of a lousy way to advertise it. Would have been more
interested in the product without the picture. Just my 2 cents worth...

Who wouldn't? On the other side, MagiC gest upgarded all the time.
I just wished there could be more info on what is going on. It
would be nice if Andreas could set up a website for MagiC with
news, info, what is comming and docs to read. Now many
people doesn't know what MagiC does and doesn't and those who
knows are a few selected persons, atleast it's how I fell about it.
If he needs help with translating into english I bet that there are
a few willing to help.

>
> If this information is outdated, please correct me.

From what I have heard it will have ISA and PCI slots so adding ethernet
would
be very easy and cheap. An ISA card doesn't cost much.

But I have heard that the Milan 040 my not be released at all and that
they
will go for the 060 directly. This is apparently becuase there are
almost
no 040 left to buy. This is bad news as it will raise the introduction
price.

I still think we should wait to say if it will be a hit or not. Give it
a
chance atleast.

I don't have the Compendium here but in AES 4.1 Atari added some
extended
modes to shel_write() and MagiC supports one of them (if I remeber
correctly),
limit memory useage for a launched application.

> >which the majority of people on this planet speak. Something like the

I don't think so. Maybe we could just for the fun of it see how many in
this
groups speaks german and how many speeks english. This is a
international
group of atari users so it should reflect the state pretty well.

No, but it would be nice if MagiC was a bit more stable, or whatever
the problem is. GEMDOS errors can't always have to do with buggy
programs.

> Well. Nor does it for a disk based TOS or MiNT. But in theory you

Before moving to the Falcon I used to use Mastersound on an Ste. I have never been able to get Mastersound running on the Falcon, and do not know of any other sample editors/recorders which allow you to assign a set of samples to keys. The ability to play samples from the computers keyboard is handy especially if, like me, you do not have any midi equipment.

Nha, those were the old days. There are some much better things on its
way. Take a look at:

http://wwwperso.hol.fr/~softjee/
http://wwwperso.hol.fr/~softjee/anglais/register.htm

They (Emanuell) sell a midfile player and are working on something
called
EXPAND which will be a sampleplayer in your computer (Falcon). Cool
stuff
and miles ahead of Masersound. It works just like a real
synth/sampleplayer/
midi-expander stuff. It can't realy get much better than this.

Hi Gerry,

Seriously obsolete, no not at all since quite a lot of companys still use ST's, Pitney Bowes for example is still using Atari Mega STe's extensively. Amiga was fortunate enough to get a break and have Gateway 2000 purchase them. As for software, no big name companies produce software for it anymore, but there are still quite a few individual programmers producing top quality professional software for the ST's, CAB 2.6 (a Netscape compatible browser) is an example. Several companies are producing ST clones with 68060's and PCI slots capable of using certain existing PCI adapters such as Video and SCSI and such, so the ST's are far from obsolete, Atari may have discontinued the ST's, but the computer community has not and is still keeping it alive and strong.

Curt

True, you'd still have to run the Control Panel, but you wouldn't
have to open any CPXes. You could just run the Control Panel and
then close it immediately.

Message-ID: <67mbl4$f04@ds2.acs.ucalgary.ca>
Source record: 111367

Friends, I am on the 'horns of a dilemma -

I have been using Atari computers since the early 800 days (still have a 135XE with 2 5" floopy drives and tape drive - chuckle) but regularly use a MEGA/STE which is developing some 'burps' and is in dire need of service - so -- rather than chuck more money on repair of this system I am deciding which way to jump - PC or Mac ??

I would like to continue to use That's Write 3, Pagestream, LDW Power & Informer 2 - or port my files over to another set of software that will do the same thing and are generally file compatible - or will take ASCII files so that I don't lose, and need to rebuild, all my financial and DB files.

I understand MagiC will run these on a Mac and Gemulator works on PCs - the question is - which way to jump - or do I bite the bullet, save all my files as ASCII and leap into the arms of wee willie Gates and Windoze before he manages to destroy Apple completely ????

Serious replies would be appreciated at this point - Thanks in advance

Brian Smith (in warm - 3C, sunny, Calgary)

>
> Are there any other servers/channels, that make a good place to
> practice?

Try ircnet.demon.co.uk or efnet.demon.co.uk. Try using ports 6668 or
6669 on those as that might give you a better chance of getting on.

Ah, that could explain why I couldn't make a connection. I was using
1, just because I had no idea what it was asking for.

>Try ircnet.demon.co.uk or efnet.demon.co.uk. Try using ports 6668 or

I'll do that. Thanks for the info!

I run COPS from MAGIC/APPS with the setting to allow it to terminate
after a minute. This means that everything is initialised a boot up
and COPS quickly gives back its RAM.

From: mille@tripnet.se
Message-ID: <67mnn0$m02$1@minox.tripnet.se>
Source record: 111375

Hi!

What! Did I use a Microsoft e-mail app? Yes I did, but not now <grin>

Ha-ha, yes I have sold my soul to Mr Gates, alright... :)
No, The ASH Emailer is not released yet. The reason why I'm here with this Free MS Product is that I haven't found a app to my Falcon that can cope with BCC (Blind Carbon Copy) for my mailinglist channel Atari with now over 300 members.

I had had used NEWSie before but every member in my mlist received every members emailaddress before the mailcontent shows up. That gives 300 rows + 5 rows content. :(

MyMail by Erik H�ll is close to solve these problems, think he already have.
But then some other problems appaer instead and one of these is that there�s a limit of how many members you can have in a mailinglist (This is a mailserver limit, not the email client). I know that MS Outlook Express do something automatically to slice the mail into smaller contents but how?. I could of �course sort out my mailinglist into swe, am, ger, eng -users instead.

And then I have some other headaches to solve, buy ASH Emailer for money or start to config STiNG with PPP (my provider support PPP and SLIRP (not SLIP) or STiK with SLIRP), if so then I have to relay on that MyMail actually serve my needs. I have already bought PPP-Connect v1.0 (CAB 2.5 upgrade) and installed a v1.1 upgrade (CAB 2.6 upgrade) for money (again), will I spend more money or leave?
..and MS Outlook Express is still free :(
Then I have to export my mailinglist from Outlook into a text file, render and use it in MyMail, somehow.

Maybe this not gives me headache, but I have som big projects ongoing, I have not time to sit and manually reconstruct channel Atari. I was one of the first here in Sweden that have managed to use MS Active channels with the new CDF-format (Dynamic), that was in the beginning of september. Now a MS IE4 user can be "Pushed" by me :)) and he/she have a Atari icon on his/hers Win95-desktop :)
..I have a family to take care of as well.

So, I�m stuck with MS for a "short" while.

Maybe Mr Buchmann can solve this by sending me a free copy of ASH Emailer due my swe translation and support.

Hi there ,

Has anyone successfully got Cadaver to run on their Falcon using Backwards (or any other downwards compatible program) ???

If so, could you please let me know exactly the config setting it requires, as nonoe of the ones I have tried seem to get it to actually run the game. ((I can get the intro screen with scrollin g text, then once I select the language version to run it usually sits in a state of perpetual load))

Many, many thanks if you can help me out.

Cheers,

John E. Cash

> But it is much easier to be admin/sysop of a BBS than of a webserver.

I'd say administering a web server is quite a bit easier, as most is
standardized stuff, while for BBSs everything is proprietary.

> And
> much cheaper.

A bit maybe. Not much.

> If a reseller will release updates via WWW/FTP they can't
> control(*) who will get a version and who not. So everybody could download
> a version.

Bullshit. Every web server supports password controled access to the
pages, and about all the CAB.OVLs support this too now.

Another solution is to pack the update into an archive that is locked
using a password. This way the binary can be even uploaded to FTP servers.

> And it's not toooo tricky to hack serial numbers.

This one missed the point I'd say.

> Besides, much more users have a modem than an Internet account.

Have you every considered dialing up a BBS in the US or Australia or
somewhere else in the world ? Don't tell me you'd do it. Basically
you're asking for something that you do not want to do yourself !

Considering this, much more users could access the web pages if ASH
had any, than dialing up their BBS.

> (*) I know that there a several ways to control it, but it is not as easy
> as the MAUS software.

As with most software, it's easy if you're into it, but it's fucking
difficult to use it if you've never done it before. Locked archives or
web pages can be made so much easier, after all, what's so difficult
with surfing to the page, entering a password, and click the download
link. Now trying to use a Maus, I found it far from intuitive, I usually
have to search the Maus manuals all the time to achieve what I'm up to.

Cheers Peter

I guess I used APPLINE. But there is heaps of such programs that allow to
check how much RAM is free.

> If NEWsie could work on the 520, this would be excellent. There are more
> 520STs out there than any other Atari 16bit and up. I am not sure if they are

I guess the best sold one was the 1040 STF(M), which in Germany at least
has been sold more than any other Atari machine, probably because of the
ease of handling a machine that got the floppy drive built in.

What the hell does it with an FPU ? Or is just that it tries to save and
restore the FPU context on task switches ? Too lazy to priorly determine
if an FPU is installed ? Can't the kernel be compiled with FPU usage switched
off ?

>
>But maybe that is what is so funny... quoting 30 lines of text.
>
>//Magnus Kollberg

hey Magnus, you have a problem? 30 line of text quoted is nothing, You
might prefer a jpeg 70kb in there??
YOu know that if you can't get 30 lines of ASCII, then I think you
better unsubscribe this newsgroup, coz I mean, come on!, 30 line if
what? half of second to pay on your provider, what do you say to
people that are selling ST stuff? or what about the BOTS reporting the
NEWITEMS from their ftp server? or some bullcrap about sinclap, or
just all 90% of what's happening in this newsgroup?
I just think you got pissed off, coz YOU are also using a microsoft
newreader, and you felt concerned.
Is this newsreader THAT slow that it would cost you 4 DM to get 30
lines of text?
Also quoting is part of the rule in case you didn't know.
Coz mind you NOT everyopne is following this newsgroup everyday, OR
some people don't get ALL the messages. Just like you did about Mille
posting. So quoting is necessary. What about a message like:

Yeah! I agree!.
(NO quoting, no nothing, do you think people understand what's
happening?, it's even a worse loss of time here, coz you don't
understand shit about what happened).

So, and I am already sorry about writting this little message, coz I
know you will read it, and I know you will have to pay 3 DM to read my
bullshit. but well. The best I think is, Newsgroups ARE the worst loss
of time (if you have to pay the phone hourly). So do not subscribe to
any. That'll save you time/money.

Bye..

I've never heard of this prog, are you suggesting that I should try to open
the directory of an audio disk wherein I will find this prog? (if this is
what you mean then it is a neat idea).

>I have not tried Video CDs because I don't have any but I don't think they are
>handled by SPIN.
That's a pity, for I have a couple of CDs with Q-Time movies and a
multi-media CD which Extendos handles reasonably well.

Not having a hard drive on a 1040 ST, the demo doesn't work from a floppy. I already have the parallel drive so getting a SCSI one is out of the question. How much is HDDriver 7.1 and the special adapter in U.S. dollars? (not being familiar with DM)

Huh? That's news to me. I've ran into very few programs that wouldn't work with MagiC, and none that were even close to being indispensible.

I'm using basically the same programs as I was before, except for those programs which aren't multitasking friendly (which still worked, but not the way I wanted), or that I no longer needed (such as TOS patches).

If anything, I've added more programs that need MagiC, or work better with MagiC, than I've thrown away because they don't work with MagiC.

From: thechyld@pcc-uky.campus.mci.net
Message-ID: <882848608_OASIS_@pcc-uky.campus.mci.net>
Source record: 111155

First of all, I've got Cab v2.5, the 1.27 OVL, Gemjing (pack-in), running under Neodesk/Geneva...Now, when I test the Gemjing module by loading up the test page, it will "moo" but I can not get it to quit. I tried control L-shift, like the docs say but that doesn't work. It makes me do a full power off reset. What URL can I go to, to test Gemjing on? Thanks! :)

Well, that sounds like a SCSI communication problem. To get some
help, you would have to give some more details (hardware, host
adapter, scsi driver, config files???).

Well, you need at least a driver which implements the SCSI driver protocol
(if you are using spin_sd.bos). That would be either HDDRIVER, CBHD or
SCSIDRV.

You'll pay about $50 for HDDriver. I'm not sure if the special
adapter is even available in the U.S., since this is the first I've
heard of it. You could probably order it from Europe, but I'm sure
it would be cheaper to just get a SCSI drive and sell your parallel
drive.

Just wanted to say that I am a happy Falcon owner (amoung many other Atari products).

I don't care how long a post someone makes.

I don't care how long their sig is.

I think that CAB for $50.00 is a decent price no matter what is or is not included.

I don't care if F/S post are made here. I like to read them (Atari related).

I think all the STiK apps, clients and their authors are wonderful.

I think that STiNG and Peter are fantastic.

Actually either could be wonderful or fantastic:).

I don't think that an application in deutsch is all that difficult to use. After all, Ataris are kind of universal in their function. A dialog is a dialog, and a drop down menu is a drop down menu. Es mach nicht bekommon etwas leicht.

I think we have one of the best newsgroups on the net.

In that newgroup, we have some very knowledgeable people (even with spelling problems:).

We have some of the most colorful software and hardware people around for the base size of this platform.

I don't care if I am in someones kill file. Their loss:).

What I do care about is this arena goin to crap. If it wern't for this place, who the hell would I talk to about Atari computing?

Happy Holidays,

Mike

Could you use CAB 2.5 with Sting ? What if I want to buy the new browser but continue use Sting and its clients ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it
--

Yes, so long as you use the CAB.OVL designed for STinG/StiK by Dan Ackerman. The latest verison is 1.2706. Keep in mind that CAB, regardless of version, does not communicate directly with your IPS. If you use the *.OVL that comes as part of IPConnect (?), STiK/STinG will not communicate with CAB.

On 21 Dec 1997 18:08:19, "Gerry van den Berk." wrote:
>I thought the Atari ST was seriously obsolete, and i guess i am right.

Yes, most people would consider a 12 year old computer obsolete. Many computers are can be considered obsolete, including ALL Amigas, Ataris, and generally most PCs that are 2 years old. It doesn't mean that you can't use them for what they were designed for and enjoy them for what they do. Having just brought my ST out of the closet, where for 5 years, I thought it belonged there, I was amazed to see NEW software developed for it. It is 12 years, old and can run all the Internet software available. Including a Graphical web Browswer. Not bad considering its age. Truth be known, because of the power of an 8mhz design from 1985 , I would have to say this old beast was pretty advanced for its day.

>It never could quite cut it, could it, against the old Amiga.

I am a former Amiga owner, A500, A3000, A2000 toaster with 040. I really don't know what your are trying to say? Must be looking for a fire? I was hoping to get reaquainted with the Amiga users, but it would appear their arrogance shall continue to their very grave. You actually are sounding like a PC user now:-) In biker terms this would be, Go ride a harley.

>I won't give too much shit about Atari as being second best in the home
>computer stakes at the time was pretty good.

Why mention it then?

>Heard about the PPC developments for Amiga 2000 and up???.

Who cares? Its not that I don't this is just not the right forum to discuss it.

>Not trying to start a flame war but Quake is about to be released for Amiga
>and Myst already has been. I know it a bit late but at least it does show
>how versatile an operating system AmigaOS is.

Yes you are, so take off. Believe me if an ST user suffered from computer envy it certainly wouldn't be from what an aging Amiga receives. Theres lots of PC development that we don't get, however, I do recall having many years of use, doing things PCs could never do. I can't believe an Amiga user is still as stupid today as they were 12 years ago. Get a life or get REAL. Really is nothing happening in the amiga newsgroup? Try something positive, I really can't take you seriously? Amiga OS? Wait I just floated down from the planet of ignorance. Ah yes, wonderful OS, NOW GO AWAY:-)

Can't see an Atari port in
>the near future.

Possibly a useful question, but most likely no port. Man will I ever be able
to live another day?

>Is Atari ST technology still being developed? (serious question!)

Now to not be sarcastic, I was shocked to see stuff still being developed, but
like the Amiga, the market continues to decline. I currently believe that
68030s and up, can be purchased cheaply and upgraded to be very useful platforms
to work on. Unfortunaetly I ditched my 3000 etc. about 2 years ago for
pentium 166 to continue to do animations. The speed increase in rendering was
amazing. And one can not wait for technology on one platform to catch up.
That is why we used Ataris and Amigas in the first place. Now I consider my
ST a cult machine, and actually still very powerful. I am having more fun
with it everyday. Gee I must be a born again ST user:-)

>Is there a future?
>

Yes, about as bright as the Amigas. I believe there is a guy named Sinclap you
could speak to. I don't know him that well, but I think he is your type of character.
Also, you might be better off to use the advocacy area as opposed to this
newsgroup as we really are interested in solving problems and helping others out.
I hope its the same in the Amiga newsgroup when I snag one of those to play
with again. After, I get a TT and a falcon, which I originally passed on for
the Amigas, back in 1991-92. Oh yes, my 500 I had in 1987, was the worst piece
of crap I ever owned, and it probably more than anything, ticked me off,
more than the most ignorant bragging amiga user, whom I have little respect for.
Thank god, I kept my ST at that time, so I could do work.

>The Atari is dead, let it be.
>

Gee, I never heard that one before. Guess it doesn't help that Atari is gone
either. However, there is a really , really good group of people I have met
here and this is what has made computing fun again. They are friendly, smart
and the developers are incredibly thoughtful, when discussing features and
ideas for future updates.

To have a computer built in 1985 with the first version of the operating system
run the most Current software, tells me its not obsolete, just old:-)

Now do us all a favour and go away. To all more mature users I am sorry that
I have been baited. Perhaps it was all the JUNKMAIL which has just started
to appear in my email. I guess I was lucky before, the volume now is just
ridiculous. I am so angry I could ****.

I tried HTTP://www.iemmc.org/remove.htm but I think I wrote it down wrong as
the resolver times out before its found. If somebody can help, with the address
again, I would appreciate.

Later brian

Well, if my two cents means anything, I'm a Falcon nut to the extream.
I have a Quadra 900 (slow by todays standards) and MagiC Mac is the
only way I would to run TOS applications on an alternate system (if I
had to go out and purchase another setup anyway). You don't
need a high dollar Mac either. I think even the least expensive Macs will
suprise you with the speed and compatibility that MagiC Mac has to offer.
Be sure to get a current version (I think it is up to V2.X now). The
newer version offers more compatibility with ST applications and is Mac O/S 8
friendly.

My guess is, that's the best seller in the U.S., too. Most people
wanted the extra memory of the 1040, and yes, the built-in drive, so
the 520 was never a really big hit.

Ira,

Falcon might work from the hard drive if it finds the floppy in the
floppy drive for verification. Otherwise, it was not hard disk
installable as it was copy protected.

But obviously there's no point in starting an argument about that.
If ASH wants to sell MagiC outside the German speaking countries,
they'd better make english programming documentation available (which
might be there already).

However I find it a bit silly that some people obviosly have a hard
time accepting that English is not always the language #1.

I was born in a french-speaking country. However, I've come to learn
that English is the de-facto international means of communication, so
perhaps ASH and other german Atari developpers should accept it too.

Brian,

Give TOSBOX a try on a friend's PC and see if it will run your current software. If it does, it's only US$10 to register. MagicPC, MagicMac and Gemulator are all much more expensive -- US$150-200.

To Oliver from ASH,

Can MagiC be changed (apparently only a slight change is needed) to run properly on a Falcon with Afterburner and the ToolKit software? On my Falcon MagiC won't boot up with the ToolKit because of some Fast RAM implementation of MagiC's.

Magnus, help me out here... ;)

I have a Migraph Hand Scanner for sale for $40.00 U.S. I only used it for times and it is in its original box. It works great as I was really impressed with it. It only works for the ST computers as it won't work on my Falcon. It comes with all original software including a bonus Easy Draw package. Please fell free to inquire via E-MAIL if interested.

Brian, I too enjoy using my Atari ST software alot, and still have my
Mega ST4, but with a new baby on the way, I sold off my prized TT
while back and missed the greater speed, but have a clone for internet
access along with the ability to bring work home when required.

I just last week ordered the Gemulator 98 (Version 4.8) and installed
it in my Cyrix P-200 system with 64 megs of ram. It seems to run much
faster than my TT did, havne't installed alot of prgs yet to fully
test it, but have spoken with others who have Pagestream and LDW Power
running on there Gemulator equipped systems. You can probably get
the $99 deal still for the card + software with you supplying the
ROM's from your Atari (TOS 1.4 or above recommended, I myself had TOS
2.06 from a defective TEC TOS upgrade card I had purchased used a few
years ago). It was a simple installation, simply drag the software to
your PC's HD, (Gemualtor files) and plug in the 8 bit ROM card in a
ISA slot and run the config software. I don't think it will probably
run game software worth a ____, but for true GEM applications, I think
this is probably the best way to go. If the software is TT

compatible, it should run great here I think. But, of course, since
running so fast.

Here's some Gembench numbers on a TT setting with
TOS 2.06 and Fastram settings

Gem Dialog Box 584%
VDI Text 3472%
VDI Text Effects 31%
VDI Small Text 4800%
VDI Graphics 61%
GEM WIndows 416%
Integer div 314%
Float Math 23%
RAM Access 266%
ROM Access 288%
Blitting 197%
VDI Scroll 1299%
Justifed Text 79%
VDI Enquire: 346%

Display 1147%
CPU 258%
Average 893%

This is what mine is, your mileage may vary..

EXACTLY - With three versions of CAB out with in 4 months (2 available here in the US) and a fourth on the way, why the heck should I spend $50.00 (US) and then have to spend another 30 to 40 dollars on an "upgrade" in an other two months. If you count up the money that one would have spent on CAB todate, you could almost buy a used 486 with NetScape.

The fact that German (and French) Atari programers have, for the most part, ignored the english speaking market has, in my opion, accounted for part of the loss in our market of Atari users. When you can not get modern and up to date software, you eventually have to go with the platform that has the software you need to use.

OK, my two cents worth...

I now own CAB 2.5 -- total cost ended up to be CDN$90 (including duty). PPP-Connect and its clients are useless to me. I have no qualms paying the initial $90 for just CAB, though, since it's such a nice package. But what if I want to update to 2.7, let's say, for cookie support. There's $40 right there (too much for just cookie support). Then, let's say, 3.0 comes out with HTML 4.0 support -- there's another one (although that would be a major update). Unlike other software, a browser is never 'finished' because of ever-changing standards. This creates the need for more constant updating. Many people, like me, will just end up 'skipping' one or two updates altogether.

ASH's upgrade policies are unfair. Minor updates to CAB itself should be free or at least inexpensive. If someone wants the other stuff and their updates, then they should pay more. But it seems too late for that now.

Hi Charles - Nope, I'm waiting for Jim to get all the headaches worked out, and then HE can send his dial scipts to ME, so all I have to do is fill in my name and password. With STIK, it was the other way around... I got things working first, then helped Jim get on board with aa.net. So, be sure and help him get things all figured out so I don't have too!! :-) Lazy??, well I'd prefer "efficient with my time usage". See ya,

Hi Jim;

Try telling your ISP to turn off VJC. My provider's doesn't work with
Sting so I have to run with it shut off. If it's on, I can get a conn-
ection but experienced the same problems you describe.

Hope it works.

Merry Christmas all.

Willard.

Greets all!

OK, I'll ask what I've been wanting to for a while.

What is the best, Geneva together with Neodesk or MagiC?

Is either compatible with most software?

How are they different?

Will MagiC run on a 4meg Mega with TOS 1.04?

Hope to get some "lively discussion"

Regards,

Willard.

Well, I've never used Geneva/Neodesk, but I have been using MagiC for awhile, both on a Falcon and on an STe, and I think it's great. It's very fast, stable and gives you preemptive multitasking.

And most of the new software coming out is written with MagiC in mind. That doesn't mean it won't work with Geneva/Neodesk, but it means it will definitely work with MagiC and worth well with it.

Also, there is some software, such as PPP-Connect, that requires preemptive multitasking. You have it with MagiC, but you don't have it with Geneva/Neodesk unless you add Mint to the equation. And even then, some people have had problems.

So I would have to say that MagiC is definitely your best bet. It seems to be the most supported and most compatible of the two.

This is correct, the specifications says max 100 addresses in a mail
so thats why i have this limit in the mail MyMail.
To get the program sending mail to more addresses
i have to automatically slice the addresses
and re-send the mail several times.
This is on my to-do-list.

>And then I have some other headaches to solve, buy ASH Emailer for money or

Keep on working with your atari pages as they are covering
many things and can show other platforms that Atari is
NOT a toy to play game on. (all new games are released on PC) ;-)

>So, I m stuck with MS for a "short" while.
I hope you can use MyMail when i have added support for more
mail addresses in the program.

>
>OK, I'll ask what I've been wanting to for a while.
>
>What is the best, Geneva together with Neodesk or MagiC?
well best, make your choice.
Magic is faster, a total rewrite of TOS.
Magic has a nicer interface, but geneva is pretty nice too with
neodesk as you can set almost everything you want.
Magic gives you a smoother multitasking environment.
However Magic is pretty much unstable unless you run 100% clean GEM
application, (which unfortunately not that many).
You can forget about half of the software you own, magic will probably
crash and make you to reboot.

>
>Is either compatible with most software?
Geneva is very compatible, much more than magic.

>
>How are they different?
Afaik, geneva is just a layer that makes the AES part to multitask,
keeping the TOS, while Magic is a new TOS down there, giving you much
better control of the multitasking (preemptive), and shoudl support
pipes, etc. Much closer to MiNT.

Geneva is much cheaper also, and joined with MiNT, you can (with more
ram though) experiment a little of the unix world with some MiNTOS.

>
>Will MagiC run on a 4meg Mega with TOS 1.04?
>
Yes no prob. 4 meg is plenty for magic, or geneva. On mint+geneva and
MiNTOS, you can think about 8 meg at least to have something
workeable.

So, at the end, you just need to know what type of program you will be
running, what are your needs?
This will answer your question I think.
hope it helped. bye.

Perhaps you have the version of Cab 1.5 that is described in the ovl htm document that doesn't work. IRC there are some versions of 1.5 that are different. What I would do is download another version of Cab 1.5, and get the latest cab ovl which seems to have a newer version every couple of weeks. Really, Cab shouldn't be a problem to get running if you managed to get STing 1.06 working. Also, I fully recommend getting STing 1.08 as it is very much improved over 1.06. Remember to keep Cab ovl in the working path of Cab. Its always good to recheck the basics.

>
>I can connect via newsie 0.82,IRC,Finger,telnet,etc.

Gee, I can't get telnet or finger to work:-)

>I still get resolving host?

Yes, I believe it may be the version of Cab that you have, there is some mention in the overlay docs.

I honestly would go for the a Pentium, and the Gemulator. It will run all the
software you are concerned about. Besides, Derek is a Canadian too:-) However
I am still very Magic ignorant, so you may get so differences of opinions.
I also believe that no matter Macs previous reputation, they really are dead
in the water, and will eventually join the rest of the motorola boys Amiga
and Atari in 68000 heaven:-). Really a case of two late for them as well.

4810. Lit_net Med Net Midi Com

Newsgroup: comp.sys.atari.st
Date: 1997-12-24 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <67ppjrjpj3@newsbell.bellglobal.com>
Source record: 111168

Ok, I just went out and bought me some midi cables. I have a 1040STe with
2 meg of ram, that has had a problem corrupting the harddrive since new.

Question #1: I was told by Halvard that some of the early ones had a bad
DMA port? This could be the case. If this was true would an
internal IDE drive be affected?

Question #2: Has anyone had any experience with lit_net, Med_net or Midi com?

The version of midi com, I have is a partially functional share
ware version. It looks more thorough than LIT and MED however
the docs are in German and I have been using ROUGH TRADE to
interpret as best as I can. It helps but there are some gaps.
(Ironically rough trade was released as public domain, the day
I downloaded it from the michigan archives, its a good program)
Also , easy as lit and med net are to set up, the docs being
translations are not that clear. I notice that there is no file
locking and certain things to avoid. I am not sure if they are
talking about avoiding to access the same DRIVE or Partition, or
file at the same time by two computers. Midi com seems to have
some sort of file locking but I don't understand it yet.
I am going to back up my hard drive and read the docs again.
Midi comm, being partial, I am going to avoid even though it looks
better, unless someone else has used it.
I will probably have installed med net by the time you read this
and crashed my hd. However I am looking for all useful comments.
THis is not a temporary measure. I want these networked.
Backing up my HD brian;-). PS I am aware of the network from
ST informer and will be happy to hear any comments from its users.

Question #3 Of course I want to use either computer to access the internet.
IS there a possibility of a conflict with STing and the midi
nets?

Question #4 Has anyone used the remote dialer of STing, or set up a point
to point network through the midi ports? If so could I see your
cfg file?

The bottom line is that I have currently two computers I want to network. I want
to be able to share the hard drive with the ST being its host. This allows the
STe to have access to the drive without corrupting everything on it;-). I also
want to have the modem hooked up to the STe or the ST I haven't decided yet, and
I want to be able to access the modem from either computer. Preferably using the
STe on the net as TOS 1.6 is more friendly to certain software such as Cab
Cache, and Swampdogprg. Currently this is not an option because of the HD
problem noted above.

While my questions are not clearly explained, I will be happy to read all comments that are offering help no matter how confused they may sound to me;-).

THank you in advance
Brian.

4811. Music

Newsgroup: comp.sys.atari.st
Date: 1997-12-24 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <67ppk6jpj4@newsbell.bellglobal.com>
Source record: 111169

Of course going to the music store to buy the midi cables, opened up a whole
can of worms. My local music store was a former Atari Dealer until Atari stopped
suppling them computers. Their contact with Atari happenings has been weak for many years,
they are into selling music stuff:-) and my contact with them brought forth
some questions.

Can anyone give me a list of currently supported ST--> Falcon supported
midi software, or links that you know of to current developers. Also is there
a midi newsgroup that covers Atari computers?

He also wants the link to the Toronto Atari Federation.
By the way, this site has never worked for me using CAB, which is why I don't
have the link handy. I can load in the Web page, but thats all, anything else
I select, simply searches my local host cache of my computers hd=error.

I am looking for this stuff after this post, but if you read this and can
help I would appreciate it.

Also a list of software suppliers, and hardware suppliers would be helpful.
BOMBARD ME WITH STUFF.

Software support links are great,
Hardware locations and software distribution in North America are preferred.
Such as best electronics etc.

He is still very interested in atari computers, but hasn't had any contact
with atari related information in years. He has 3 MegaSTes which he will not
sell. He is looking for Atari Suppliers and support so that he may help customers
whom he sold STs to in the past.

Also can someone tell me if Falcon clones are really being produced.
Does midi software work on the Hades, etc.

Finally he runs his entire operation on the Cricit cashregistar software
made by Igor ???? of Kitchener Ontario. THis is excellent software and he is
happy with it and doesn't want to change platforms because of it. If you know
of the authors name or where abouts it would be greatly appreciated.

I want to help this vendor as much as possible. It is ironic that he has a
Pentium based midi display, and lots of Windows based midi software, yet with
all this power around him, he has still got his 68000s doing the work for him.
Even his brochures are made with Calamus.

chro_MAGIC Software is still producing and supporting Pianistics and
Guitaristics and both work on any ST, STe, TT, or Falcon.

Our web site is located at:

http://www.chromagic.com/

In addition to our own productsm we also carry a WIDE selection of
Atari/TOS software from around the world (including CAB, HD Driver 7,
MagiC, Electronic Cow MIDI Series, etc). Our web site has a link page
with links to many of the currently active commercial Atari supporters.

BTW, we are running a special sale on our fully populated (16 Megabyte)
RAM Gizmo boards - see our web site for full details.

4814. aFTP in Med Res

Newsgroup: comp.sys.atari.st
Date: 1997-12-24 00:00:00 UTC
From: outrider@anv.net
Message-ID: <67puuo$3km$1@usenet47.supernews.com>
Source record: 111172

Is anyone using aFTP in medium res? I'm getting only half the window that shows the files, with the bottom half off the screen. And with the bottom half off the screen, I have no way of getting to the sizer, to make it smaller. I've tried changing the font size, but it tells me there is no font selector loaded, even if I have UFSL or XUFSL installed.

This looks like a great program, but if I can't see all the files, it makes it somewhat useless.

Any ideas?

The best part about CAB is the "do what I mean" activity.
It knows the quotes belong before the '>' so it puts them
in for you.

Nice touches like that make it a perfect site development
tool.

-> Hope to get some "lively discussion"

-> Regards,

-> Willard.

I'm a Falcon owner who started off with a beefed-up 520STFM. I purchased Magic 4 a couple of years ago. When I tried to use it I had numerous problems with it (CD ROM drivers, screen problems like ghost icons, background leaking through the current application screen, etc.) I have reason to believe that my configuration files weren't exactly right. I tried and tried to experiment with it and finally gave up.

I guess what I'm trying to say it that the manual that came with it was barely adequate. there was so little information in that tiny little blue book compared to the features of the software that it left me confused and frustrated. I finally lost patience and bought Neodesk 4 and Geneva. Compared to Magic 4 Gribnif had the best documentation for their software and left me impressed after my experience with Magic. Geneva with Neodesk in my opinion is a fantastic combination and I am happy to say that I am successful with it. It works pretty smooth on my Falcon with an autofolder program called 'Romspeed' which loads TOS into RAM for faster performance. I only have problems with incorrectly written software. Even though Magic works faster I prefer using TOS so I can run campatibility programs like Backwards II for my old games. I understand that Backwards II rewrites some TOS routines and even mimics the old TOS bug in TOS 1.0.

I'm a very satisfied user of Geneva and Neodesk.

Later,
James
Boise, Idaho

I'm running a 1040STe with MagiC 5.11, an ICD AdSCSI Plus, and
HDDriver 7.04. Not sure what you mean by config files. Here's my
CONFIG.SYS:

; Beispielkonfiguration f�r SPIN!

```
; CD-ROMs auf SCSI 4 (8 + 4 = 12) und ACSI 5
*BOS, c:\gemsys\magic\xtension\spin_sd.bos, A:7

; als logische Laufwerke S: und T: installieren
*DOS, c:\gemsys\magic\xtension\iso9660f.dos -c32, O:A
```

Note that I don't have the .dos file. Do I need it?

It sounds like it's not resolving the host or something. If there is
a hang up, it will sit there, as if it's crashed, for a few minutes,
and finally it will time out.

Make sure you have your configs set up right. And if you can, let it
sit for five or 10 minutes to see if itl will come out of it. At
least then you'll know it's having a problem connecting or
handshaking and it's not crashing.

Can you run other programs at the same time (you're multitasking,
aren't you?).

OK Julian, I'll mail him to get in touch with you (he doesn't have newsgroup access ATM).

>>I've gone back to Extendos since I cannot get Spin to access audio or video
>>CDs, despite the loss of long filename support (and b/ground DMA, although I
>>don't use it).
>
>Hmmm. Could you please describe this in more detail? I'm constantly
>using audio CDs. And what video CDs are you talking about?

Using either Extendos' audiocd.prg or Alexander Clauss' CDPlayer (V1.4), the CD flashed the "busy" light on and off as if the CD were being read, but there is no response to commands from either program. The track display is not updated and it is impossible to eject the CD from either prog.

I'm referring to Q-Time movie files, using Guillaume's Mplayer prog, and some movie clips from the Homa Systems House Space Missions CD played via its "front end" program.

This is on a 14Mb Falcon with MagiC 5.11 and HDDriver V7.02.

Rgds, Derryck

Sorry, this is a little too hard, isn't it?
There are some programs which have problems with MagiC, but they're old or a hack.
90% of the software should run.

I've been through 2 sites where I got *.wav sounds (quite surprising
experience, mainly if you browse with no images... CAB keeps on showing
loads of incoming bytes as the page is entirely displayed and suddenly,
music !).
The first is the Jo Vandeweghe site (not only on the main page)
http://ping4.ping.be/dipching-drulkhor/INDEX-E.HTM
and the second was on the home page of a fan of Mobb Deep (if you like hip
hop). For this one, all I remember is the site was in sweden (something
like an .se domain, isn't it ?).

Merry Christmas to all who will read me...

Mine's just called GHOSTLNK.LZH. NOt sure where I got it from but it is not rare - try Jo's UTSI (??) which has the 'top 450' programs on it.

>Can I boot the ATARI from a PC drive?

No. You run Ghost from the ST with a 'slave' on the PC. You will see the PC partitions on the ST GEM desktop and can manipulate the files (delete, copy/move) as if they were native ST files.

>Whats the downside and any other info perlease :)

None really, it does what it says. The limitation is the tranfer speed which will be the slower of ST serial/PC serial.

There is a prog. PARCPC (??) which will do the job faster over the parallel ports but I don't know much about it.

Oh! The CTRL+Shift worked for me! The only prob. I have is that the
sound is about an octave lower than it should be. Can't think what
that might be.

Jo Vanderwege's site has some audio on its home page.

Hi,

> Greets all!
>
> OK, I'll ask what I've been wanting to for a while.
>
> What is the best, Geneva together with Neodesk or MagiC?

I think it is really down to personal preference.

> Is either compatible with most software?

I would say so..

>
> How are they different?

I would say that the main difference between Magic and Geneva
is that Magic is a complete Operating System replacement and
comes supplied with its own desktop, MagiXDesk. Geneva
only replaces the AES and requires a seperate desktop, such
as Neodesk or Thing.

Both Geneva and Magic are great packages and both have their
following. Both packages offer a similar speed increase over the
standard Atari Operating System, and both Magic and Geneva
(with MiNT installed) offer pre-emptive multitasking.

I own both Magic 4 and Geneva 6 and although they are both great
packages I currently prefere to use Geneva. Despite Magic having
some fantastic facilities such as background file copying (far
better than Windows 95 file copying) and the ability to hide
processes I find that Geneva offers just a little bit more than
Magic. With Geneva you can configure everything from the way in
which buttons look, whether you want drop down, pull down
or windowed menus and offers several configurable options to try
and persuade those older applications to work correctly.

Geneva also comes supplied with a comprehensive ring bound manual
which explains eveything you are likely to need to know about Geneva.
When I received Magic 4 for my Falcon, I was very dissapointed at
the rather tiny and inaccurate panflet that accompanied the install disk.

Other advantages I feel that Geneva has is that the number of
apllications run at any one time is only limited by memeory (compared
to Magic's fixed limit), version 6 has a nice new task manager, it can
run without a desktop if you are low on memeory, it has online

hypertext help (not ST Guide format though) and updates are available
for download from Gribnif Software's Home Page.

On the other hand, Magic does offer good background file copying,
has an ever growing list of supporting and specific utilities and
add-ons and now offers Windows 95 compatible long file name
support.

In the end it simply comes down to personal preference. As I have
already said both are great packages. Although I currently
prefere Geneva, buy next week I may prefere Magic.

>
> Will MagiC run on a 4meg Mega with TOS 1.04?

Both Magic and Geneva will run on a 4Meg ST, although
Geneva has lower memory and disk overheads.

I use a Mac for interent and have returned to the Atari ST for MIDI
music sequencing. I have downloaded some files to transfer
to the Atari but am not having much success.

If a file is described as a zip file what does this mean. I assume it
is a form of compression, so how do I uncompress it?

Other files have the extension ".lzh" Again I'm guessing a compression
system, but how do I uncompress?

When I'm dowmloading into the Mac, is it possible I'm saving it on the
Mac in a format that makes it unreadable to the Atari?

Excuse the many questions, probably quite basic, if you wish to Email me
direct rather than fill the list with stuff fell free. My Email is
davyl@enterprise.net - before you hit reply with your newsgroup software
note message below!

Many thanks,

Davy Lamb

The truth is still out there!

Sun, 14 Dec 1997 15:54:59 comp.sys.atari.st Thread 40 of
66
Lines 39 Ultimate Virus Killer 2000 - SPECIAL OFFER! No responses
karies@wxs.nl Ritchie at World
Access

Good day to you all, Atari friends!

I am releasing a definitive version of my "Ultimate Virus Killer",
now called "Ultimate Virus Killer 2000", version 8.0. Now is your
chance to get your hands on the definitive piece of virus killing
software for the Atari ST/TT/Falcon range of computers. Here's what it
can do...

1) It can kill more viruses than any other virus killer...right now
over 100!
2) It is the only virus killer that can recognise "UVD Virus", "Carpe
Diem Virus" and "Pharaohs Curse Virus"
3) For the past two years or so it's been the only virus killer that's
still updated, and it will continue to be updated at least twice per
year
4) It works on any ST/TT/Falcon system with 1 Mb of memory (or more)
5) It supports any multi-tasking OS that exists
6) It also runs on GEMulator and PacifiST on the PC

This piece of software can now be yours for the amazing price of US$
10 (or 5 British pounds, or 15 German marks, or 15 Dutch guilders) -
and that includes postage! And the special offer is that, if you send
off your order before 1 january 1998, you will get the next update (to
be released around summer 1998) COMPLETELY FOR FREE (sorry for my

shouting :-).

So don't think twice and get the definitive virus killing tool for the Atari range of computers, the "Ultimate Virus Killer 2000" version 8.0, right this minute.

If you need more info, email to me at karies@wxs.nl.

The address to order at is Richard Karsmakers, P.O. Box 67, NL-3500 AB, Utrecht, The Netherlands.

Of course, while I'm at it, I would like to use this message to wish all of you the best Christmas you've ever had, with a cool 1998 to follow!

This should help.

>Well, I have the 'cracked' ST version and I'ld post it to you if only I
>knew how to post the disk with boot sector. I don't.

I think you could use the Magic Shadow Archiver (MSA) packer. I think
it makes an archive of the whole disk, including the boot sector.
But of course I don't know how emulators like that kind of approach..

Nevertheless, Oids was a great game. I wonder if the author did anything
else...

Probably because WAVs are typically 11 or 22 KHz and DMA supports
12.5 KHz and 25 KHz. So they're probably being played at the wrong
sample rate.

Greetings and Merry Christmas;

I've decided lately to try my hand at IRC. I've downloaded the two
programs to do it. I try to connect to irc.demon.co.uk and go to #atari
but I get disconnected immediately when I try this.

Can someone help an "irc idiot" get going and not get banned worldwide, etc.

Which is the best software to use?

Thanks,
Willard.

<
I'm a Falcon owner who started off with a beefed-up 520STFM. I
purchased Magic 4 a couple of years ago. When I tried to use it I had
numerous problems with it (CD ROM drivers, screen problems like ghost
icons, background leaking through the current application screen, etc.)
I have reason to believe that my configuration files weren't exactly
right. I tried and tried to experiment with it and finally gave up.

I guess what I'm trying to say it that the manual that came with it was
barely adequate. there was so little information in that tiny little
Geneva vs MagiC (p3 of 3)
blue book compared to the features of the software that it left me
confused and frustrated. I finally lost patience and bought Neodesk 4
and Geneva. Compared to Magic 4 Gribnif had the best documentation for
their software and left me impressed after my experience with Magic.
Geneva with Neodesk in my opinion is a fantastic combination and I am
happy to say that I am successful with it. It works pretty smooth on my
Falcon with an autofolder program called 'Romspeed' which loads TOS
into RAM for faster performance. I only have problems with incorrectly
written software. Even though Magic works faster I prefer using TOS so I
can run campatibility programs like Backwards II for my old games. I
understand that Backwards II rewrites some TOS routines and even mimics
the old TOS bug in TOS 1.0.

I'm a very satisfied user of Geneva and Neodesk.

Later,
James
Boise, Idaho

Hi all: I also use Geneva & Neodesk on my Falcon with Logic Audio and
Cubase and it works great. I also had the same problems with Magic C
One question, where can I gey the program "Romspeed" ?
Thanks, guitarra.

A favor - could someone with CAB 2.5/2.6 try Agfa's home web page (in Germany) -http://www.agfa.com- and let me know if you can connect to anything else using the pull down lists and clicking on "GO".
When I try it using CAB 2.0 (demo) I get 170/3540 received and then a CAB message stating the transaction failed. I am using the latest CAB.OVL and STinG.

Using the secondary lists at the bottom of the page does work, but none of the pull down lists will make a connection.

Source record: 111203

Hello!

I finally got an Atari ST. Hooray.

The guy I bought mine from said it was a 4meg 16MHz STe. It's not a MegaSTe, though; it's in a standard 1040 case.

Is there any way to check how much RAM I have (short of opening the case)? The label on the top of the case is 1040STe, but the FCC ID is: EBA4160STE, so perhaps it is 4meg?

As far as the CPU speed, I'm assuming he's just mistaken, and that it's 8MHz, unless there were a few 16MHz 1040STe's (I thought the MegaSTe's were the 16MHz ones).

Does anyone recommend a TOS upgrade or a desktop replacement? I am only going to use the Atari for a few programs, so I'm thinking I should just leave it as is, but if anyone has any thoughts about it, that'd be cool.

I have a SCSI Zip drive for my PC I'd probably like to use with my Atari. I was checking out ICD's site and their Link 2 and Pro Utilities 7.0 stuff -- is that a good choice? My Atari Hard Disk Driver is version 3.01. I got the computer with a Megafile 20 (20mb goes a pretty long way in Atari land), and I'd still like to use that -- would it be affected by the ICD stuff? Can I put the Zip drive after the Megafile?

Hmmm. . .what else. . .oh! Is it possible to get a new front metal label for an SM124? From Best of B&C? Also, my SM124 was built in Sept. 1985. The picture is sort of slanted, more at the top than the bottom (the top left corner almost touches the edge of the glass, and the top right corner is .25 inches down), but other than that it looks fine. Any way to get rid of the slant?

Does anyone have a preferred method for cleaning Atari computers? The Megafile is a little dirty looking.

Lessee. . .lastly, on the info sticker of my ST, instead of SERIAL NUMBER, it says, SERIAL NUMBLE. What's the deal? I was unaware of this terminology.

Thanks for reading this and any help you can give me!

I would say the best program is atarirc0.78 available on Lonny Pursell
page, constently updated, check out on http://www.bright.net/~atari/

>
>Can someone help an "irc idiot" get going and not get banned worldwide, etc.
well to get banned, YOU NEED to do A LOT!, and eventhough it's pretty
hard to get banned.
Just try some server with 6667 or 6666 for port. Then come on #atari
irc.stealth.net 6666
irc.funet.fi 6666
for example.
Sting for some reason takes a long time to get you on the irc, Don't
know why, but from Stik or other stack, it's much faster.

[snipped]

Hi Steve,

I haven't purchased CAB yet, however, I just went up using CAB 2.0
(Demo) and experienced what you describe. I did manage to use them
though.
After you get the transaction failed message (or the byte counter
stops) just click on the Fuller, or manually resize your window a
little bit. This forces CAB to update the window. Once it starts
updating, it will continue to load the remainder of the page. Note
that I only tried 4 different selections - and that the Fuller update
bit needed a little tweaking one time - after it updated, I stayed on
the home page-but-when I selected the same item & hit "Go" it loaded
directly.

You can't run any Atari programs via Ghostlink. You just get access to your
PC's hard drive. It's also kind of slow, but what do you except with 19.2kbps
(or whatever the maximum transfer rate is, don't remember).

Just check out the document included in ghostlnk.zip.

I've been looking through everything I can find to get a list of the commands to work with a Fax modem. The books that come with them only include the modem information, not Fax, Caller I.D., or Voice.

Also, I'm looking for information on accing devices on the DMA bus directly, and the SCSI commands to do things like config, reset, status, read/write/format.
There is an Abacuse book, #13, that deals with Atari drives, but I don't know if it helps in this area.

Thanks for any help.
Rick D.

That's similar to my experience with Magic. There have been a few that I'm not too happy about losing, like Tempus2 and the comms program Freeze Dried, but most of the others that I have work quite well. Most will work while multitasking whereas some need to be single tasking. Sometimes setting a limit to the memory helps, as does turning off pre-emptive multitasking. Most, as you said, were indespensible.

> I'm using basically the same programs as I was before, except for
> those programs which aren't multitasking friendly (which still
> worked, but not the way I wanted), or that I no longer needed (such
> as TOS patches).

Same again. There are, however, a few exceptions. I can't use Tempus2 as it loves to confuse Magic no matter what I do to get it to work. I can use Tempus, but I miss some of the enhancements in 2. I've yet to find another comms program to use instead of FZDT. That's another program that likes to cause Magic to crash. Other than these 2, I haven't really lost anything.

With Magic I don't need any TOS patches, with the exception of HSModem. I was under the impression that Magic didn't need HSModem, but it seems as though I do. STiNG won't work without it. :(

Although I'm a big MagiC fan, I would have to agree that the manual
is horrible, especially for an OS. Not that it was difficult to set
up (in fact I had it up and running in about five or 10 minutes), but
there is nothing in the manual beyond the very basics. I learned
more from the nets than I did from the manual.

Tempus2 doesn't even work with TOS if you use non-ST resolutions, so
it doesn't surprise me that it doesn't work with MagiC. I missed
Tempus2 when I went to a Falcon, long before I went to MagiC. But
having discovered QED, I no longer miss Tempus2. I love QED. And
best of all, it's a true GEM, multitasking friendly program.

I think it had HSModem built in at one time, but they took it out,
probably to reduce the size of the program. I have no problem with
modules like that, so if you don't need it, you don't have to have it
sitting there taking up memory.

I'm glad no one told my Falcon, because MagiC is quite stable on it.
Certainly at least as stable as TOS 4.04, if not more so.

He guys,

I've almost everything working here, I-connect, MiNTnet, STing.
IMHO MiNTnet is still the best solution for a decent Net-connection.
With some help it isn't that difficult to set the whole MiNTnet
business up and working.

>
>Andrew Harvey

You can easily modify an existing printer description to use the specific codes you want, if you have the documentation for the printer codes. There are 5 basic printer driver types, and the *.prn files simply control specific parameter details for a particular driver. If the Canon printer is similar to an Epson, then you can easily modify an Epson description to use the Canon-specific codes.

In the cubase.dat directory are 5 files printerX.sys with 'X': 0,1,2,4,i.
The first line of the .PRN file selects which driver to use:
C.1 = printer0.sys, original Epson-compatible driver
L.1 = printer1.sys, Atari SLM laser printer driver
H.1 = printer2.sys, HP inkjet driver
T.4 = printer4.sys, "fast" Epson-compatible driver
I.1 = printeri.sys, IMG-file driver

I don't know exactly what each of these drivers are supposed to do; i.e., I don't have any official documentation from anywhere. But some features are fairly obvious - the "C" driver is for dot-matrix printers that have multiple pins arranged vertically on the print-head. The "L" driver builds an entire page image in memory, because the SLM printers require things to be done that way. The "H" driver is for printers that take graphics data one pixel-row at a time, as HP PCL-based printers do. (As opposed to "C" type printers, which take data one column at a time, where a column may be 8, 9, or 24 dots, depending on the printer...) I don't really know anything about the "T" driver. The "I" driver is obvious, it saves an image into a IMG file.

The rest of the .PRN file contains a bunch of parameters including resolution, commands to enter and exit graphics mode, etc. Here is a test file I put together after a lot of experimentation. Comments start with '+'. Numbers in () denote the maximum length of an entry. If an entry has no comments, I never figured out what it was used for.

```
C.1
Test, ,80 * 80 dpi,80 * 80 dpi,15 npi
+Printer model,paper type,fast resolution,best resolution,??notes per inch??
+ (59)
```

```
+ BEST
1001, 4 + Icon Size Index - relative scale factor for Cubase font.
1002, 80 + horizontal DPI resolution
1003, 80 + vertical DPI resolution
1004, 'G','R',13,10 + Enter Graphics mode (9)
1005, 1 + unknown int
1006, '0','6',13,10 + Prefix for graphic data line (4)
1007, 'L','F',10 + Linefeed 1/n inches (6)
1008, 1 + unknown int
1009, 1 + unknown int
1010, 'P','r','e','R',13,10 + Pre-reset (29)
1011, 'S','e','t','L',13,10 + Set paper length (7)
1012, 127 + max page length
1013, 0 + 0: page length is in text lines
+ 1: page length is in inches
1014, '1','4',13,10
1015, '1','5',13,10
1016, '1','6',13,10
1017, 'E','o','l',13,10 + EOL sequence (9)
1018, '1','8',13,10
1019, '1','9',13,10
1020, '2','0',13,10
1021, 12 + Post page (FF) (9)
1022, 'P','o','s','t','R','e','s','e','t',13,10 + Post Reset (19)
1023, 'A','d','v',10 + Advance (9)
1024, 'P','o','s','t','L',13,10 + Post graf line (9)
1025, 16 + pins
1026, 2 + pin multiplier = interleave + 1
1027, 'S','P',13,10 + Special feed, every other line (19)

+FAST
2001, 2
2002, 80
2003, 80
2004, 27, ';'
2007, 27, 126, 76, 51
2026, 1
2027, 27, 'L', '0', '7'

+ Margins
1028, 14 + Left margin (1/100 inch)
1029, 100 + top margin
1030, 14 + right margin
1031, 100 + bottom margin

END
```

The "FAST" parameters are the same as the "BEST" parameters, with 1000 added to their ID. If a FAST parameter is omitted, it defaults to the same as the "BEST" parameter.

Tip: Make a copy of img.prn and call it imgfax.prn. Change the Best resolution to 200x200, and the Fast resolution to 200x100, and you can

generate IMG files that are perfectly scaled for faxing using STFax, etc.
I use this to send sheet music to my band members who don't have MIDI
or scoring software of their own...

I've successfully created descriptions for a bunch of oddball printers,
including an ancient HP Thinkjet, Pansonic 9-pin, etc... Read thru the
existing PRN files to get an idea of what they do. They don't all use every
possible parameter, so don't waste time trying to decipher a parameter that
you don't actually need.

I'm selling the following ST items:

1. Atari 520ST upgraded to 1 MB RAM. With original mouse.
2. SM124 monochrome monitor.
3. SC1224 color monitor.
4. External 40 MB hard drive in shoebox style case.
5. A bunch of floppies with software.

Note there is no floppy drive, because both of mine passed away.

Make a reasonable offer, and the buyer pays for shipping.

Send replies to my email address, and we'll work something out.

Merry Christmas!
Eric

Hi!

>Both Geneva and Magic are great packages and both have their
>following. Both packages offer a similar speed increase over the
>standard Atari Operating System,
MagiC 5 may be a bit faster because of the internal improvement of its
memory handling. (I�m not sure)

>Other advantages I feel that Geneva has is that the number of
>apllications run at any one time is only limited by memeory (compared
>to Magic's fixed limit)
MagiC 5 can handle up to 126 processes, so that isn�t a problem any more :-)

By the way: I programmed a Utility to set up the MAGX.INF config file very comfortably (the file in which all system settings are made). Supports Drag&Drop and much more. Have a look at my website (files->MagiC!Conf)

-> Rgds, Derryck

It was in 1995 when I bought Magic 4 and I spent over $100.00 U.S. for
it from Toad Computers. I didn't have a modem or any form of
communication with other users for help with it, only source of help
came from Toad which wasn't much at the time. I tried to get support
from them because the manual contained barely any information in it
regarding set-up and configuation. Even recently after I got my Falcon
I still had the same problems with Magic 4 util I sold it to someone who
bought Gemulator 98.

My point is I didn't even get much support for Magic when I bought it.
Geneva and Neodesk on the other hand had nice thick manuals for
reference and when I had a question about something that wasn't in the
manual I was able to contact Gribnif directly and easily. They took
some time to research and fix my problem which I was greatful for. I
got costomer service from Gribnif that I couldn't really get with Magic.
Someone else I would like to thank for outstanding costomer support and
patience is Roger Burrows with my Plextor problems and Extendos Pro.
It's nice to have help from them when I suffer from brain farts and
ignorance.

Later,
James Burr

I think I already have this module - only problem is that I don't have
a serial adapter. I guess if the parallel adapter only supports
b-directional ports, I will have to get a serial adapter to do
transfers with my Atari

Try to get hold of Mark Baines' PROFILE.PRG. This will diagnose and report on most h/w and s/w aspects of your ST. Apart from this you will often find that ST applications will display free RAM in one of their dialogues which will give you a clue about how much you have got.

>Does anyone recommend a TOS upgrade or a desktop replacement? I am only
>going to use the Atari for a few programs, so I'm thinking I should just
>leave it as is, but if anyone has any thoughts about it, that'd be cool.

If you have TOS <1.4 and if you are going to use a hard disc you definitely need an upgrade. There are AUTO progs which will correct much of what is wrong with TOS<1.4 but this is not the ideal solution.

You can get TOS 1.4 in ROM and just replace it. If you really have 4Mb RAM I would suggest you get Magic. This replaces the whole TOS with a faster and less buggy version and will also allow multitasking. It takes about 500-700Kb, hence the requirement for a decent amount of RAM.

The monitor components will have aged and it would be a good idea to re-align the thing. Don't try it unless you are used to this sort of work as you will be adjusting the trim-pots while the EHT is live.

>Does anyone have a preferred method for cleaning Atari computers? The
>Megafile is a little dirty looking.

One of these kitchen surface cleaners does the job fine (Mr. Muscle etc) but it is best to do this after removing the guts from the case as you can then be a lot more liberal with your attentions.

>thank you :)

Slower than floppy rates. Normally people use Ghostlink as a one-off
for transfering files rather than to make an alien HD part of the
system. If you are going to be doing this amount of to-ing and fro-ing
you should check out the PARCPC (parallel) connection which is a lot
faster.

This comment seems to come up a lot. I'd like to get Magic for my Falcon, but cringe at the thought of spending ~$100 for something that doesn't work.

Are there any test or demo programs that can determine whether one's Falcon is Magic compatible or not? Or it this not a problem anymore with version 5?

thanks,

>thank you :)

The 720 KB floppy of your ST/STE has a typical maximum transfer rate of
10 KB/s (write) and 20 KB/s (read).

With a serial speed of 19200 bps (the maximum for unmodified STs)
you get 1.9 KB/s (write & read).

That's a small bit slower than any HD... ;-)

Greetings,
Uwe.

>it with Newsie 0.84. (I suppose that was already obvious, from the headers
>in this article...) It's working fine, CAB is working fine with the MiNTnet
>OVL, everything is working fine. Weird, huh?

Weird it is. I still have some troubles.
For instance. When CAB is waiting for data it should be make clear by
a [timeout #sec] message. At least this happens with the stik.ovl.
The counting only appears when I use a mouse click or use a scroll
arrow of the CAB-window. As long as I don't use this the count value
remains the same but as some as I hit the mouse buttom for instance
the counter change one digit. With the scroll arrow the digit change
very rapid ofcourse.

For some reasons I can't use "mailto" but this has probably something
to do with my ignorance. If I try I get a "Document protected!
Please assign Name (account)" message. Any idea why?
Note: I'm doing this with CAB2.50 and ssl.ovl/mintovl.184 but a
friend of mine who has CAB2.70 encounters the same problem.
Speaking of my friend. Normally he uses Geneva/Neodesk/MiNT but with
this setup he can't use CAB2.70 with mintovl.184/ssl.ovl. CAB always
bombed out. No problems with the stik.ovl however.

Errm, Ghostlink!

It should be easy enough to find using Hallvard's search engine for example.

>Can I boot the ATARI from a PC drive?

Not with Ghostlink. You can only access the PC's drive(s) for the purpose of data retrieval/saving. You'd be looking for connecting the SCSI chains up using a bus arbitration scheme (assuming that you've a host adaptor on the Atari that supports it (and are using SCSI drive(s) on the PC I'd guess.

>Whats the downside and any other info perlease :)

That's about it...it does work but data transfer speed is limited, so you might be better looking at something like Paralink or PARC which does the same job but via the printer ports.

HTH.

Well, lets see if I can answer some of them.

H > I finally got an Atari ST. Hooray.

Hooray, indeed.

H > the FCC ID is: EBA4160STE, so perhaps it is 4meg?

Unless somebody changed the board, it is certainly 4M. Any number of
apps will check memory; try to find Jeremy Hughes 'freemem.tos'.

H > Does anyone recommend a TOS upgrade or a desktop replacement?
H > I am only going to use the Atari for a few programs, so I'm
H > thinking I should just leave it as is,

That may depend on which programs. I like Newdesk (TOS 2 or above),
which you could upgrade to. Others here will add to this....

H > I have a SCSI Zip drive for my PC I'd probably like to use
H > with my Atari. I was checking out ICD's site and their Link 2
H > and Pro Utilities 7.0 stuff -- is that a good choice?

Should work, if ICD says that it will. Uwe will tell you that
HDDriver certainly will. He should know - he wrote it.

H > My Atari Hard Disk Driver is version 3.01.

A must to avoid.

H > I got the computer with a Megafile 20 (20mb goes a pretty long
H > way in Atari land), and I'd still like to use that -- would it
H > be affected by the ICD stuff? Can I put the Zip drive after
H > the Megafile?

Sure, but not with AHDI - the zip ID won't be seen by it.

H > on the info sticker of my ST, instead of SERIAL NUMBER, it
H > says, SERIAL NUMBLE.

MagiC V4 had some bugs which particularly affected Falcons IIRC.

I'm running MagiC 5.11 on this Falcon and I don't experience any of the
problems that you outline, indeed it seems to be compatible with most progs.

Connect is a very good comms prog that is MagiC-friendly, especially if you team it with gszrz or the GEMd version of XYZ, but it has built-in file transfer protocols if you prefer to use those.

You do need HSModem, at one time the routines were to be built into MagiC but that never happened, sadly.

>Sting also uses considerably longer time than Stik when connecting to
>the mail server for sending mail - retrieval is fine...

>Anyone else with similar experiences?

Petter,

Yes - I have the same experience with outgoing mail using STinG. With
STiK the connection takes about 2 to 3 seconds. Using STinG it
takes around 30 seconds. Which makes using AntMail useless as it times
out before the connection is commpleted. On the other hand, out going
News items are very fast. Incoming mail is a little faster connection
with STiK, but not by much.

That all said and done, I am still using STinG as it supports the other
serial ports on a TT instead of just Modem 1 & 2.

Another curious thing - when I started using Serial 2 on my TT (115K)
CAB went nuts - timeout problems, lost connections, etc. Newsie,
though, worked fine. This was using HSModem7 with everything set per the
instructions. Drop the connection speed back down to 28.8 or 38.4 and no problems.
Installed FastSerial and have had no problems with Serial 2 and 115K connection speed.
Very strange.

Thanks for your tests, Terry.

I just tried things again and they're the same (locked out). Yet you're running the same setup as me! It doesn't make sense.

Were you running under SLIP or PPP? I'm running STiK/SLIP (can't use STinG's PPP). I wonder if PPP makes the difference?

Ok, I would like to know why, or if this is related only to newer harddrives. I have an SH204 and have formatted it with the Adhi 3.01. Is there something wrong with this? After a crash I cannot boot with the software from a floppy but I can with older adhi. After I get the drive to reappear I format it with 3.01 again as opposed to the older versions of Adhi. I tried newer versions of Adhi only to have huge crashes, upon which I discovered in a Faq most recently that versions newer than 3.01 don't work with an SH204. Should I not be using 3.01 in any case? If so Why? .

Hmm, I am using STing 1.08, Newsie.82, and Frac1.10, on a 520ST, and have
no problem retrieving newsarticles, I have no delays, and it has never
stopped in the middle of a download of a message.

No problems with mail either.

I will check the FTP sites, however IIRC I would get server access denied?
There have been FTP servers that have caused me trouble in the past however
such as Halvards site, which he recently corrected.

I welcome a new version of STik, but I am currently happy with STing.
I hope your problems become resolved.

I'm using the same on a Falcon with Afterburner and Nemesis. STing dials up and logs on OK, but usually sticks on "initialising..." until the 15-second timeout, then aborts. Occasionally it completes, and everything works after that. Any ideas?

Videlity doesn't seem to work with MagiC- all I get when I try and change screen resolution is the standard TOS 4.x options.

hplace@tiac.netSPAMBAD (hplace@tiac.netSPAMBAD) wrote:
: Is there any way to check how much RAM I have (short of opening the
: case)? The label on the top of the case is 1040STe, but the FCC ID is:
: EBA4160STE, so perhaps it is 4meg?

I should think so. You can use a program like Profile to tell you
aeverything you want to know about your machine (including a rough
estimation of the speed).

: As far as the CPU speed, I'm assuming he's just mistaken, and that it's
: 8MHz, unless there were a few 16MHz 1040STe's (I thought the MegaSTe's
: were the 16MHz ones).

The only chance of it being 16MHz would be if it has had an upgrade
fitted.

: Does anyone recommend a TOS upgrade or a desktop replacement? I am only
: going to use the Atari for a few programs, so I'm thinking I should just
: leave it as is, but if anyone has any thoughts about it, that'd be cool.

TOS 2.06 is probably worthwhile. Many people recommend MagiC instead, but
since MagiC doesn't do what I need it to do I don't use it myself.

Thing is an excellent desktop, as is the new ASH Jinnee desktop.

: I have a SCSI Zip drive for my PC I'd probably like to use with my
: Atari. I was checking out ICD's site and their Link 2 and Pro Utilities
: 7.0 stuff -- is that a good choice?

The Link 97 (not from ICD) is better, but often either will be suitable.

: My Atari Hard Disc Driver is version 3.01.

Reformat the disc and use it for something useful...

: I got the computer with a Megafile 20 (20mb goes a pretty
: long way in Atari land), and I'd still like to use that -- would it be
: affected by the ICD stuff? Can I put the Zip drive after the Megafile?

Yes. But as for 20MB going a long way, I have 850MB in my TT, plus a 270MB
SyQuest removable and I still run out of space all the time!

: Hmmm. . .what else. . .oh! Is it possible to get a new front metal
: label for an SM124? From Best of B&C? Also, my SM124 was built in

Best Electronics will have one.

: Sept. 1985. The picture is sort of slanted, more at the top than the
: bottom (the top left corner almost touches the edge of the glass, and

: the top right corner is .25 inches down), but other than that it looks
: fine. Any way to get rid of the slant?

Not that I know of, but if the picture is too small you can enlarge by
altering a couple of trimpots just inside the back of the case.

: Does anyone have a preferred method for cleaning Atari computers? The
: Megafile is a little dirty looking.

Just clean it the same way as you would clean anything else I guess...

: Lessee. . .lastly, on the info sticker of my ST, instead of SERIAL
: NUMBER, it says, SERIAL NUMBLE. What's the deal? I was unaware of this
: terminology.

;-)

My BBS needs a new external CD-ROM drive... double speed would be nice, but a single speed NEC would be OK.

Anyone have one?

OK, I'll ask what I've been wanting to for a while.

What is the best, Geneva together with Neodesk or MagiC?

I use magic5.11 on my falcon and it is fantastic. OK you can't run cubase and APEX etc but that is not a bother as I would not need any multitasking etc while cubase anyway. It alone gives me enough to contend with. I recommend the Magicconf.prg which is now available as a means of configuring Magic.

Hallo,

mein Mega 1 hat leider den Geist aufgegeben.
Jetzt arbeite ich stattdessen mit einem Mega STE.
Allerdings sti¿½rzt dieser beim Booten jedesmal ab, wenn meine alte HDplus
von VORTEX angeschlossen ist.
Funktionieren die beiden generell nicht miteinander, oder hab ich einen
Fehler gemacht?
Wie auch immer - irgendwie mui¿½ ich an die Daten rankommen die auf der
Festplatte gespeichert sind.
Fi¿½r brauchbare Vorschli¿½ge wi¿½re ich sehr dankbar.

Grui¿½ Alfred

>will lose all those potential users who don't have an HD

eeerm not realy?.. my last game covered 3 disks and was playable from
floppy because once loaded you didnt need to do any disk swapping, you
just leave the last disk in...for levels etc...Theres plenty of games
that take up more then one floppy about that arnt even hd compat..
look at f1 for example... no thats not a problem <smile> I just
wanted to make the process quicker for me... not having to wait an age
while everything loads in when testing routines..

>Slower than floppy rates. Normally people use Ghostlink as a one-off

yeagh that seems to be the general opinion and as such I am not going
to bother with ghostlink as its not what i am after

4924. NT/Atari Server Problems

Newsgroup: comp.sys.atari.st
Date: 1997-12-26 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <68044p$237@thoth.portal.ca>
Source record: 111115

It seems that I'm locked out of my own Web pages. CAB.OVL 1.2706 will resolve the site and then timeout waiting for data. After trying GEnie's Lynx and getting the same result, I assumed the server was down for Christmas maintenance. But everything works fine through Netscape, and I'm not being 'fooled' by its cache. HTTP 1.1, which the server uses, must be thwarting the current OVL and GEnie's older incarnation of Lynx.

What isn't so explainable is that I can't FTP to this same server anymore: AFTP and NEWSie time out after resolving, even though I've logged on to this site with them many times before (only a week ago). I tried the text-based MajorFTP thru my shell account and it times out, too. On the PC, using the application CuteFTP, I can log on fine, though!

I can understand the problem with the cab.ovl (John Rojewski's server reacts the same), but why would three different FTP clients not be able to connect to a site that worked before? Or has FTP, the actual protocol, been updated, too? The shell client I used (MajorFTP) has a 1994 copyright on it.

I do know that my hosting server is a virtual domain being run on Windows NT 4.0. But shouldn't FTP be FTP no matter the server?

Could someone test out this server (URL in the sig) using Howard Chu's cab.ovl. I would appreciate that. As for FTP, although the site doesn't allow anonymous logins, at least an initial connection can be tested (ftp://www.excelprinters.com). Resolving through HTTP or FTP isn't a problem -- it's everything after that. Things were fine a week ago and the server is definitely not down as I previously thought. I'm using STiK (if that somehow matters). Like I said, the PC has none of these client problems.

Thanks for any help -- right now I'm totally locked out from accessing that server with Atari software and my non-Atari shell clients. And I don't own a PC, which is the advice I got <g>.

>(Not that I'm not very happy with STinG.)

Well, Sting still has a few minor bugs. These are my experiences using
Sting 1.08, Newsie 0.84 and Atarirc 0.78 on a Falcon:

- Retrieving news articles: Sometimes the download stops in the middle
of a news message. After about 10-20 seconds the download continues.
- Ftp: I'm unable to resolve ftp.uni-kl.de and ftp.maus de. All other
ftp servers I've tried work fine.
I've mailed both Peter and Ronald about this problem...
- IRC: Connection to an irc server takes a very long time (if at all)

I get none of these problems with Stik (1.12).

Sting also uses considerably longer time than Stik when connecting to
the mail server for sending mail - retrieval is fine...

Anyone else with similar experiences?

- Petter -

In <67ppjrjpj3@newsbell.bellglobal.com> Brian Van Tilborg wrote:
>Has anyone had any experience with lit_net, Med_net or Midi com?

Well, I used Med_net some times to copy a backup to my TT (the backup software wouldn't work on it, and I had a 1040STfm here to fix that). If I remember correctly, it was very dirty software that tended to crash my TT during boot sequence when... errr I guess when the ST Med_Net was already active.

> The version of midi com, I have is a partially functional share
> ware version. It looks more thorough than LIT and MED

It better should be, for Midicom is commercial software, while Med_net is freeware (again IIRC, and I wouldn't pay for it anyways if it was shareware).

There are several programs who give detailed system information, e.g. Sha'uri (named after the girl from "Stargate" most presumably). There should also be CPXes that will inform you about the memory available.

>As far as the CPU speed, I'm assuming he's just mistaken, and that it's

>were the 16MHz ones).

There could be some (MegaSTE compatible or at least similar) enhancement inside. In that case, GEMbench and other benchmark tests will give a result of around 180% CPU performance compared to a normal ST.

>Does anyone recommend a TOS upgrade or a desktop replacement?

Yes, I'd strongly recommend NVDI and either a MiNT based replacement AES or Magic.

>I have a SCSI Zip drive for my PC I'd probably like to use with my
>Atari.

In that case, I'd recommend HDDRIVER also, for it ships with a ZIP CPX.

>I was checking out ICD's site and their Link 2 and Pro Utilities
>7.0 stuff -- is that a good choice?

I don't know about that software, here in .de it's mostly HDDRIVER vs. SCSI-Tools.

>My Atari Hard Disk Driver is version 3.01.

You should _definitely_ update to 6.061 (do _not_ use 6.06!).

>I got the computer with a Megafile 20 (20mb goes a pretty
>long way in Atari land), and I'd still like to use that -- would it be
>affected by the ICD stuff? Can I put the Zip drive after the Megafile?

AFAIK you can, butz I haven't tried it myself. Just get an ACSI (DMA) to SCSI adaptor cable such as Link97.

>my SM124 was built in Sept. 1985. The picture is sort of slanted, more
>at the top than the bottom (the top left corner almost touches the edge

>than that it looks fine. Any way to get rid of the slant?

None, short of opening the case (and I won't advise you to do so unless you really know _what_ you are doing). There are lots of high voltage parts inside, but also adjustable resistors (we say "Potis" or "Potentiometers" in Germany) that could be readjusted to fix your problem.

Err, sorry to correct you, but Magic is a replacement OS. The only OS replacement I ever heard of is called "Windows 95".

Magic, of course, comes complete with it's own GEMDOS etc. also, not only with an integrated desktop. Other alternatives are replacement AESs such as N.AES, XaAES, etc..

He sounded like he might actually be interested to begin with but decided it would be better to answer his own questions, he said at the end "The Atari is dead, let it be.". Sounds like he couldn't care less about what is going on. It sounds like it's just another PC user who wants to start an advocacy war and thought that maybe starting one against a machine that is 13(?) years old might actually give him a a chance of winning.

>and Domain Name are OK according to my server. I'd very much appreciate
>any suggestions that could be passed my way. I'm using MagiC 5.03
>NVDI 4, Newsie 82, Cab 2.5

This sounds identical to the problem I am having on my my TT with
basically the same setup. I just bought CAB 2.5, couldn't get PPP
connect to work and tried Sting instead. I get a connection to my ISP
and can ping the internal sting address and the IP connection provided
by my ISP. However, I cannot ping the DNS address given to me by my ISP
and therefore can't get any of the client software to do anything.
Anyone know what settings in Sting might have to be adjusted to correct
this problem. I'm ignorant about the variables involved in the TCP/IP
software.

>Question #2: Has anyone had any experience with lit_net, Med_net or Midi com?

Hi Brian,
I've used LITT-NET to network a Mega STE and STFM. It
works very well indeed and is quite easy to set up and use. I would
certainly sort your drive problems out first though. I had a lot of
problems on the Mega hard drive, all kinds of weird things which I don't
fully understand, plus a number of corrupted files, quite a lot of which I
unwittingly transferred via LIT-NETT to the STFM. A lot of these errors
creep up on you gradually then suddenly you find you've a major crisis. If
programs could wear out with use then I think I would have seen Diamond Edge
off by now. I would hasten to add that none of these problems were directly
caused by LITT-NET. It doesn't seem to like MAGIC though if this is
important to you.

I don't know which driver you are using but from my experience
this is important, I would suggest either HDDRIVER or CBHD.

Brilliant. Why didn't you just tell me to get a new computer? If I
wanted a monochrome monitor, I'd have one. I was asking how to get
aFTP to work in medium res, not how to get it to work in high res.

Okay, I'll byte. What's the difference between a "OS replacement"
and a "replacement OS"? It sounds to me like two different ways of
saying the same thing.

>MagiC 5?
I think I will release an english version, but first I have to finish
ergo-pro (will take about some weeks).
The extended Flags of MagiC 5 are already supported (otherwise we don't talk
about the same thing :-). Do you mean the dialog "Allgemeines (F8)"?
All seven Flags MagiC uses are there.

```
>I'll drop in again! :-))
Great!
```

BTW:Does anybody here know a good free webcounter? The one I'm using doesn't
count correctly (sometimes 1600, then 20, then 0, then again 600)

I would obtain some answers to some misfonctions of my falcon :

When I use screenblaster, I have scsi problems in 256 colours resolutions superior to 640*480

Sometimes too, when I turn on the computer, it doesn't boot : the atari logo appears and nothing else happens ; I must reboot and then it's ok.

The master card of the falcon is a rev B and tos is 4.04 with 65Mo ide

Does someone has an explaination of these problems ? It would be great

so .....Happy new year !

I don't think this has something to do with STing. In the past I had
this with Oasis 1.35 too. IMHO, it is more a problem on the side of
your provider then on the side ofSTing

>- Ftp: I'm unable to resolve ftp.uni-kl.de and ftp.maus de. All other
> ftp servers I've tried work fine.

The same overhere but with MiNTnet/gluestik/aFTP. I think it's a more
question of non-availably of the ftp-site.
This is what I get from ftp.uni-kl.de

=> user ftp
<= 530-Sorry, there are too many anonymous users using the system at this
<= 530-time. Please try again later. There is currently a limit of 100
<= 530-anonymous users.
<= 530 User ftp access denied.

>Sting also uses considerably longer time than Stik when connecting to
>the mail server for sending mail - retrieval is fine...

Yes I've experienced this too

Hope this help

4942. bubblejet printers question

Newsgroup: comp.sys.atari.st
Date: 1997-12-26 00:00:00 UTC
From: nospam.blackwell@virgin.net
Message-ID: <68179i$7kp$1@nclient5-gui.server.virgin.net>
Source record: 111133

Dear All, can someone help?

Seeing as my dot matrix printer is driving me crazy, and prices on new bubblejets are becoming feasable, I'm thinking of getting myself an inkjet, maybe an Epson Stylus (1st choice) or an HP.

I'm not expecting any great difficulty using it with the (spit) PC, but it MUST work ok with the ST. Specifically I need it to work with Notator SL and Calamus 1.09n.

I'd love to hear from someone who's succeeded (or even failed!) to use an Epson Stylus with either of them, especially Notator. I'm worried, cos I have a feeling this new breed of printers may only work with Windoze. :(

Could someone preferably reply by e-mail, as I'm not convinced all my usenet messages get through!

Many thanks.

John Blackwell

>cab.ovl. I would appreciate that. As for FTP, although the site doesn't
>allow anonymous logins, at least an initial connection can be tested

He,

No probs here for both. I'm using N.AES, freeMiNT 1.14.6, MiNTnet,
Gluestik 0.05b and cab-for-mint.overlay v1.84 (ssl)
For your webpage I've used CAB 2.50. At the time I was visiting your
page (21.30 MET+1) the connection was extremnely slow. Sometimes not
faster then 200 bytes/sec.
BTW: You have there a useful site. I added it to my bookmarks.

For the ftp-site I've used aFTP v1.3b1 (MiNT version)

This is what the log file says about the ftp-site

```
=> LIST
<= 150 Opening BINARY mode data connection for /bin/ls.
<= 226 Transfer complete.
<= 220 jazz Microsoft FTP Service (Version 3.0).

=> user ftp
<= 331 Anonymous access allowed, send identity (e-mail name) as password.

=> pass martin.byttebier@ping.be
<= 530 User martin.byttebier@ping.be cannot log in, home directory inaccessible.
```

I also tested your site with STing 1.08 and the cab.ovl v1.2707 with
CAB 2.50 for the webpage and aFTP v1.3b1 (STik version) for the
ftp-site.
No probs either. CAB loaded very fast your "tos_main.htm" At 3500
bytes/sec.

4945. Help for MiNTnet prob

Newsgroup: comp.sys.atari.st
Date: 1997-12-26 00:00:00 UTC
From: Martin.Byttebier@ping.be
Message-ID: <883175950_OASIS_@ping.be>
Source record: 111136

Hello,

I'm trying to get working Connex.prg v.0.7.2. This is a GEM dialer for pppd. Although the docs says it's very easy to use I can't make it work.
If I press the "Connect" buttom I get on the upperside of the screen a line containing lots of strange characters. The counter starts but no modem reaction. After 34 sec. I get this:
"The connection was lost! Do you want to reconnect"

The same message appears also if I drag my dialscript to the "Connex" window. One different though. I don't get that line on the screen.

And this is what I get on the syslog file

Dec 26 22:45:56 ping1030 pppd[26]: pppd 2.1.2 started by root, uid 0
Dec 26 22:45:56 ping1030 pppd[26]: warning: not in tty's process group <149>Dec 26 22:45:56 pppd[26]: Connect: ppp0 <--> /dev/console
Dec 26 22:46:26 ping1030 pppd[26]: LCP: timeout sending Config-Requests <149>Dec 26 22:46:26 pppd[26]: Connection terminated. <150>Dec 26 22:46:26 pppd[26]: Exit.
Dec 26 22:50:14 ping1030 pppd[28]: /dev//usr/etc/pppd <150>Dec 26 22:50:14 pppd[28]: Exit.

Anyone an idea how to solve this?

BTW: I'm doing this on a Hades 060 running freeMiNT 1.14.6/MiNTnet/N.AES/Thing 1.20

TIA
Martin

John,

See if you can still find an Epson Stylus Pro - I know these work as I have one - use it with Speedo and Calamus SL. There is a special driver for SL that allows the use of 720 dpi, don't know if it will work with 1.09. The Epson drivers that came with SL (Stylus Color) work fine with the Stylus Pro at 360. I don't know if the drivers are backward compatable with 1.09. Quite frankly, you should seriously think about upgrading to either SL or DA's LayOut. Chris, at Computer Direct, has info.

If Notator SL prints using either Speedo or NVIDI, then you will have no problems. There is a special Epson Pro XL driver (works as a CPX - not thru the normal "Print Driver" Speedo dialog) available that works great with the Stylus Pro.

I would imagine that the newer 400, 600, and 800 ones will work as well, you just will not be able to access the higher resolutions (above 720x720).

If you can find a used HP500C or 550C, drivers are available for that as well.

The printers that you have to be carefull about are the cheap laser printers that say something like "Windows Optimized" or some such nonsense on the outside of the box. These require Windows and a PC as they use the computers CPU instead of having their own onboard processor.

If you need additional info, e-mail me.

Steve Hammond

Ahhh, you're back with us, Charles. And yes, I do feel like that steel
marble -- but something's really 'tilting' this machine of mine.

So you can't connect to my URL. That makes me feel better, because it
seems everybody else can. I wonder if proxy servers are the answer?

>NEWSie/WENSuite/ppp was unable to connect also. So, it seems you need a
>proxy server to be successful. It may be of help if Web site testers

>MiNTNet vs MagiC/Geneva or STiK vs STinG. Of course, I could be wrong,
>it's happen before ;)

I don't use a proxy server of any kind. My ISP's help file doesn't even
mention one. I'll ask them about that, but don't forget that I can't get a
connection using FTP either... the connection is refused, so I can't even
attempt a login. That's the strangest part, especially since my ISP's BBS
shell client (MajorFTP) won't allow a connection either. That's why I
suspect some sort of domain blocker (silly as that sounds). Just over a
week ago I could view my pages in CAB and FTP as I pleased -- whatever
changes were made happened within the last week, but they weren't at my
end. Besides this, STiK and its clients are working great for me.

CAB's disk cache, as other people have mentioned, is not the source of the
problem. Somehow it's more complicated than that, as evidenced by the FTP
problem.

Steve:

I brought up PPP because I thought it could be a possible reason. I was
'grasping at straws' <g>.

Hi!

Matthias Jaap just released a demo of this well-known webeditor by Falke.
FaST Club is the U.K. distributor of the full version.

Another app from Matthias, Tabi is updated as a special 1.5 X-Mas release.
This wonderful app makes exported ASCII files from K-Spread 4, LDW
Power-Calc, Texel and Atari
Works to be accessible from Internet as HTML-tables. Nice if you want you
CD-audio collection to be on-line instead of locally stored as a Atari Works
spreadsheet.

Is there any chance this has something to do with the way scc.prg is configured? If I remember correctly, the StinG docs say that one of scc.prg's flags has to be changed to 'on' -- LAN bit or something like that. By default it's set to 'off' in the original hsmodem7 archive (this using setter.prg to view the parameters).

Or perhaps the Nova card is generating interference on the serial 2 port?

Yes. But if you want that GEMJing stops playing without having to press
any keys when going to another page in CAB, you'll need Mint (will work
also under Geneva) or MagiC 5.

Neil, this is just a wild guess but check with your ISP (by phone) and see if they uploaded new software or reloaded their sever software with in the last week. If you are connecting via a SLIP account using STiK make sure that your ISP has commpression turned off for your account. I had this happen to me about 2 months after I got on the 'net with my provider. Everthing was going along fine and all of sudden-bam, nothing I did would get me through. When I called my ISP, after fooling around with at least 3 techs who were clueless I found one who actually new that my TT was a REAL computer. I told him the symtoms and he checked on his end. Lo and behold someone had forgot to turn off VJC.

Because SM124 are damn cheap, at least were I live. I got two of them
for free (from a friend) and they are usually announced FS for 30 DMs
(~20 US$).

Is there anyone in this ng, that has any experience with FIFI the new
ftp program from Application System ?

I can't get it to work properly. It will not let me save the preferences,
it make a messy desktop, dialog and windows won't go away, and somtime
it won't quit. I have to make a coldboot, just to get the system going again.

I using MagiC v.05.13

cheers from Joergen, and a Happy New Year to all.

4961. CAB 1.5 printing

Newsgroup: comp.sys.atari.st
Date: 1997-12-27 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <683vja$oc3$2@newsbell.bellglobal.com>
Source record: 111002

Is there anyone printing from Cab with an SLM804laser, and if so, how are you doing it? I only have GDOS and a few different meta SYS files. When I save as a meta file, it creates a file that I can't load into Calamus, or Easy draw or Meta view. I have also tried straight GDOS printing with no results. Currently I can't print an HTML page, HELLLLP

Thanks.

No, that's not the problem. Nothing has changed with my provider.

Let's forget STiK for now. Below is what's shown when attempting to log on
through two different FTP shells. In both cases, like my STiK clients
NEWSie and AFTP, the connections are refused:

Connecting you with FTP now...

Well, then, try running Falcon from your hard drive with the master disk in your floppy drive, at least when you start the program. Maybe you can remove it once it begins. Otherwise, I have no idea about any utility to make it run on an HD. If you already have it there isn't it already patched?

From: kenny23@ibm.net
Message-ID: <34A5A681.19D9@ibm.net>
Source record: 111007

Hello,

My hi res monochrome stopped working (sort of) and I am hoping that someone can advise me on how to isolate the problem. Not much appears to be wrong with it, but a while back it began to flicker more and more frequently until the video cut out completely. Occassionaly it comes back on but not for long. The local repair shop had no luck with it at all (after 3 attempts). I would love to get it working again. It is not the SM124 but a slightly bigger model (13" screen?) possibly a QC ###?

I'd be grateful for any tips.

>results. Currently I can't print an HTML page, HELLLLP

If I remember well I always succeeded to print with CAB 1.5 (I now own
2.5d version) under NVDI 4 ... with my SLM 605 which is virtually the
same than the SLM 804 ... in fact it uses the same drivers ...

The only problem is the printing resolution ... it's a very low one or
better said :"a very very bad dithering coming from the CAB/NVDI
combination" ...

Thought we can not say every program badly uses the SLMs because when
printing from PixArt under NVDI ... we obtain the best results ...
even better than Calamus printing (not very good dithering from
Calamus either :(...

But, really if you use Speedo or NVDI rather than GDOS you'll obtain
some results with both these atari laser printers.

I know this could not help much but ... who knows ?

Jo

Ok, I was driving home and came up with this idea. I do not know if you all know this already, but I wanted to share this anyway.

I did not know that it could be possible to see all the contents of a partition of my hard drive on a CAB page and also start any program from there. I came up with this idea and did not know if it would work.

It works! An I was able to run Ant Mail , IRC, Telnet by clicking

on its name on the www CAB Page!! :) I find this very useful as I

have now on my HOTLIST a page marker that enhables me to call any

of the NET related programs from with CAB!!!

May be it could be useful to you too I hope. Would it be possible

to have the program on a www page and by double clicking on it

download it and run it? I will test this and see.

Have fun, guitarra.

>Does someone has an explaination of these problems ? It would be great

Hi there,
I would suspect that you need to make one of the CPU-clock modifications to get rid of the problem.
Schematics are available on my homepage (troubleshooting section) and if you're the least experienced with a soldering pen, it's fairly easy to make the modifications. However, if you're not sure that you can do it - don't even try - leave it to someone who can instead...

Best regards,
Claes

-> > him thanks.....Now back to you 16 colors...

-> He sounded like he might actually be interested to begin with but
-> decided it would be better to answer his own questions, he said at the
-> end "The Atari is dead, let it be.". Sounds like he couldn't care less
-> about what is going on. It sounds like it's just another PC user who
-> wants to start an advocacy war and thought that maybe starting one
-> against a machine that is 13(?) years old might actually give him a a
-> chance of winning.

If this guy who 'just wanted to know something' he should have
just asked his question instead of making some of the comments he did.
Stating 'Atari is dead, let it be' is pretty insulting to an enthusiast
who is proud of my Falcon and former ST. You tell me what other
computer that is 12 years old that is as popular getting the support,
like CAB, STiNG, etc. As long as we enthuiasts use our Ataris, Ataris
aren't dead. So there! Na nan nan na na!

James
Boise, Idaho

P.S. I LOVE being a kid. You want to see immaturity though, you should
have checked out comp.amiga.marketplace the last couple of weeks during
the Clinton bashings.

4978. Is there IBM software for STWriter-->WP/ASCII?

Newsgroup: comp.sys.atari.st
Date: 1997-12-27 00:00:00 UTC
From: james.burr@acpu.com
Message-ID: <883183482@acpu.com>
Source record: 111060

You wrote:
-> Subject says it all. Please respond via email. Thanks.

I used ST Writer for quite a while as my primary word processor.
Unless your IBM word processor can import 'as is' ASCII only files
otherwise they won't work. ST Writer is shareware written for the ST
computer in the mid to late '80s and distributed with one of the Start
Magazine (or one of the others) disks of the month. There is no IBM
version. One time I had written a program with ST Writer for Q-Basic in
school and saved it as ASCII because I didn't have Q-Basic at home. I
took it to school and editted with an IBM machine DOS system editor and
later debugged it on a machine with Q-Basic.

If you do have an IBM word processor that accepts ASCII but
won't accept an ASCII ST Writer document you might just have to change
the file name extension from .TXT to whatever the other word processor
takes and see what happens.

Hi Raymond. You sent me something that started with MYSCREEN.IMG
followed by a long list of unrecognizable characters. I kind of
expected a message that said attached file to this message from my BBS
service. I saved that in text format for First Word but I'm not sure
what to do with it.
If it's not working is it (ATARIRC.APP) on your web page? If I can't
download an attached file I may have to use the Internet computers at
our public library. Someone else mentioned at our last Atari Users
group that he had problems with downloading attached files also. I
don't know what archieve format you used if any either. I'll continue
playing with it though.

>problem. Which card did you have?

Right now, I'm using Chro-Magic's Ram Gizmo as well...I've got 4 4 meg,
30 pin SIMMs rated at 80ns...perhaps the speed is the problem. Titan Design
did say that they had not found -any- Falcon Ram board that used 30 pin SIMMs
that worked 100 percent right. They highly recommended that I go with a Ram
board that uses 72 pin SIMMs, rated at 60ns. (they are selling EDO, too). I
am also using the latest Nemesis which is slightly faster than older versions,
now running at 25/50mhz. That might make it slightly less tolerant... :)

HI,

I'd like to know if there are drivers available for the newer printers I currently use NVDI 4.11 and Atariworks, but will be getting Papyrus 5.15b soon. There's an update for NVDI - ver 4.12 available, but I don't know if there are any driver updates accompanying it. Appreciate any info that folks out there may have. Thanks and Happy New Year!!!

Hi,

About Cab OVL 12706, has anyone been able to download it? Everytime I try , I get a "memory block destroyed by user program" dialog via MagiC 5.12 and I'm summarily bounced out of Cab(2.5)and and my poor Falcon locks up. I've tried the lower case workaround with the same results. Thanks.

4990. Re: NT/Atari Server Problems

Newsgroup: comp.sys.atari.st
Date: 1997-12-27 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <682c8k$7u5@thoth.portal.ca>
Source record: 111072

Thanks to everyone for their help. I honestly don't know what to think. I'm sitting at the keyboard puzzled as could be, having attempted things once again tonight. In a fit of paranoia, desperate for answers, perhaps the server is now setup to block connections from my domain (dsoe.com). That's too far-fetched, though. Mind you, the FTP shell client I used (which failed, too) originated from the same domain. But then GEnie's Lynx browser won't connect either (resolve, yes). I was going to try FTP through GEnie's shell but all their Internet services are 'unavailable' right now.

Charles Silver originally led me to this problem. He was testing the 'mail:to' function of CAB.OVL 1.2706 when it was first released and couldn't log onto the site. He sent e-mail asking if the server was down or if it was the new OVL's fault. After tests, I said it was the server, which ended up to be untrue. But he's been away for a while -- I would certainly like to know how things work for him now. Matter of fact, within the same time frame, Charles kindly tested my problematic STinG configuration. Perhaps his cross-border server tests came across as some form of security breach (there's that paranoia again... but the timing is uncanny).

While attempting to do an FTP connection, both NEWSie and AFTP completely fail. The modem's 'send' light flickers but the 'receive' light doesn't. This tells me the server refuses to even acknowledge the clients' request to connect. Other FTP sites work fine, ruling out a software problem at my end.

Other than some form of domain blacklist, there's nothing else I can think of that would cause my connection problems. I'll try GEnie's FTP shell when it's up and running to see if another originating domain gets me in.

>don't own a PC, which is the advice I got <g>.

Neil,

I like the page - esp. the cartoon of JT :). I had no problem accessing
the page using CAB 2.0 (demo), CAB.OVL (1.206) and STinG (both PPP and
SLIP). The latter should not make any difference as the protocol only determines
how your computer connects with your ISP - not ISP to ISP. This is on a
TT with 20 megs/Nova card/using either Geneva or MagiC (4.0). FWIW I use
FastSerial instead of HSModem. This is connecting through the Serial 2
port at 115K with a 28.8 modem.

Hope you are able to figure out what the heck is goin on...

Regards,

Steve Hammond

ps: someone else mentioned clearing your CAB cache - it is a worthwhile
thing to try.

By slirp, do you mean slip (Serial Line Interface Protocol)?
In that case, you can use 2 different tcp/ip layers: StiK or Sting. Note
that Sting also handles ppp protocol. The cab 1.5 browser and the last ovl
is a good choice IMHO. If you have any worries in configuring the thing,
just ask here ;-)
A new browser has been released in France: WenSuite, but it doesn't do slip
yet.
If you have more than 1Mb, you can also try mint/mintnet which is very like
unix. But it's mostly text-based.
Bye.

>
>Note that I don't have the .dos file. Do I need it?

You don't need it as long as you use the XFS. Any chance that you have METADOS
running instead of METAXBS?

As a general remark: one of the big advantages of SPIN! is that it uses open
and documented interfaces for everything. This allows to mix person A's SCSI
driver with person B's BOS driver and Julian's (:-) XFS. But then, this also
makes it very hard to identify a problem.

It's always a good idea to start with a solid MetaDOS setup (BOS driver, DOS
driver, METADOS.PRG) and then to replace components step by step. I myself
usually run the BOS driver from CD-Tool, so that I don't have to worry about
possible problems with other people's SCSI drivers.

I don't know about Extendos' audiocd.prg. Does it use Atari's standard commands? Regarding Alexander Clauss' program: I heard that there were some problems, but that seems to be fixed with the latest release of CDPlayer.

Howdy Kemosabies,

My ISP uses Sprint.Net as a backbone. I've been trying to help Neil and myself understand why I can't connect to his Web page/ftp site. It just times out. Well, when I use the STinG tool "Tracer Route" to the IP, 204.174.222.225, it does 8 hops to 206.186.255.150 and stops without finishing ;(Obviously, if I can't trace it, I can't resolve it with any StiK client. Ahhh, I beleive 206.186.255.150 is a IP that Sprint-Canada uses as 206.186.255.110 is! Basically, I can't "trace" to any IP that's 204.174.222.xxx though "resolve" says many are Web sites. They all, the valid Web sites, do exactly the same thing as Neil's Web site...

Is that why some can connect easily, yet others can't? The main provider www.axionet.com, I can connect to fine (207.102.157.50), but any of their clients that use the IP addresses of 204.174.222.xxx (All of these puppies are virtual Web sites) are dead ducks for me. I tested this on a "clean" net at 2:30am.

So, is Sprint.Net to blame here??? All guru's are invited to respond :)

CU,

Charles

AFAIK, it uses a proprietary encryption algorithm to protect the
interests of the VideoPlus company. Neil Barker sent me a listing for a
program in C which will perform en- and de-cryption, but it's been
archived, and the copy on my (Atari) hard disk disappeared when it
crashed. Presumably, VideoPlus license the decoding chips to the
manufacturers of VCRs.

Internet providers can be pretty clueless, and considering I knew nothing
about the internet until 2months ago (thanks guys), I have discovered that
most nearly error resulting in disconnections has been at their end. I
suspected they may have changed things on you but you just don't know.
I have been able to connect with VJC on with my 520ST and actually connect,
but when I went to my first url address WOW , biggest crash I have ever seen
in my life. Clearly since we can see your web page, the problem is most likely
your provider. Don't take any crap from them, if you bug them enough and talk
to them politely it will get resolved. You might find you are not the only
one? Getting a PC is not a solution, but a foolish comment made by a foolish
person. What do they say when someone with a PC has trouble? The kind of
computer you have makes no difference, so this shouldn't be an issue, either
they KNOW what they are doing at their end or they don't. This is the problem
with many of the TURNKEY, internet providers appearing all over the place.
Perhaps you could say, run a real network with linux or something, but seriously
they should be helping you connect. And lets hope that if the problem is at
either your end or their end that it gets resolved.

Also, I use my computer to get free Internet Access for a month at places.
I tell them I have an Atari = blank stares, then I say I want to hook it to
the internet=laughter, then I ask if I can use their service for a month,
while I test out my system. In total disbelief they usually go for it, thinking
you won't get hooked up anyways. This is really handy for when you want to
change IPs if you get my drift.

Good luck,
Brian

If ftp.uni-kl.de has reached it's user limit I get the message
"server access denied" running Stik.
Under Sting however, Newsie just hangs with the "connecting to host" dialog
and nothing more happens. I've tried plenty of times, but never been
able to get into this server (or ftp.maus.de) with Sting.

I use MagiC 5.11 with my Falcon, and apart from some older programs needing to be run in single-tasking mode, nearly all my apps work just fine! Certainly all new application software coming out of Europe really needs to be MagiC compatible to have a good chance of success IMV.

The one downside about MagiC, as others have mentioned, is the totally crap manual!

But there's enough knowledgable people here to help you out on the finer points I am sure.

It's your choice really, I've never used Geneva/Neodesk so I can't give a comparison unfortunately. Certainly people that have both MagiC and Geneva seem to find it hard to come down heavily in favour of one or the other!

But, basically, MagiC WILL run on a Falcon, with very few problems. As I said before it is the older apps that cause the problems most of the time. Look at the stuff written for the ST which should run on all machines, but it don't!

Best regards
Mike Kerslake

Is the Atari ST (Falcon030 more particularly) still supported commercially at all, or is the only lasting support the mere few drops of anemic shareware/freeware blood that drip into it's veins?

I would love to have reason to own a Falcon030 again, but I find it hard to warrant one... especially since I have a 120MHGz Power Macintosh 8500/120 these days... runing BeOS on a separate partition.

Reply directly, if you like.

The next part is a document in HTML format, Is there a way to maintain
the integrety of this file? When I load it into CAB it looks the same as
below, just showing me the source code. I just downloaded a version of HTML
HELP and discovered it could remake it into an HTML document. Some friends of
mine with windows constantly send me email in html format. I ask them not to
but the practice continues. Is this a normal practice for a newsgroup as well.
Is there a way of viewing the document without having to use HTML help.
I know that other people can use their web browsers and view the document perfectly.

Oh yes, and there is a TT for sale here as well:-).

I am using 16 colours, I am a little kid, and I know an insult when I see one. If its information someone wants, they will get it here, and all one has to do is ask. Apparently "now back to your 16 colours" continues to show a condescending approach to goodwill. As for picking on a 13 year old machine hey 1998 is just about here:-), the original author still had to bring in Amiga, to help back up his attack. lame lame lame.

One thing I remember about the A3000, was trying to do realtime animations. We were porting our Cyber Animations from the Atari to the Amiga to increase the colour and resolution and run in realtime. Simply maintaining the same 16COLOUR 300*200 resolution on an A3000 68030 25mhz, couldn't maintain 25frames per second, on a complicated piece of animation. When more moving items came on the screen, the Amiga slllllooooowwwwweeeedd down to a crawl and as the items turned and less objects were required to move the Amiga would speed up. So much for real time animation, we had wanted to use the higher resolution for realtime, but obviously this did not happen and we ended up doing single frame animations. Remember this little old ST of mine could move very complicated objects around the screen in the same resolution in realtime at 300*200, 16 colours indeed and fast too:-). Of course that was along time ago 1990, and alot has changed in 8 years, which is why this false claim for help/information is so very lame. Sorry to hurt your feelings, but one does not tease a dog before going to pet him, unless he wants his hand bit off. And for the person who did answer him without sarcasm , well, some dogs behave better than others, and are well disciplined.

Oh you falcon owners, I am always so envious:-). 65000colours.

Message-ID: <6860tgqko3@newsbell.bellglobal.com>
Source record: 110955

>
>>Does anyone know where I can download a cioy of Dungeon Master
>

Yes;-). But I am not going to tell you:-(.
However I do, for some strange reason, own about three copys of dungeon master
and 2 copies of Chaos strikes back. Don't ask:-). I consider them original
backups now.

Great game, I have never had the time to play it, well I mean I have only
had the game for 10years, and their is only so much time in the day:-).

Unfortuneately downloading Dungeon Master is considered software theft. And
yes it is difficult to get ST software. However to my amazement, Atari isn't
dead just yet, if there where no distributors, no venders, no development
no one trying to break even or only lose $1000 in the Atari market, well then
perhaps this newsgroup would be more forgiving of this request.

I would just like to point out, if you looked in my closet you would see
many boxes of software that I purchased through to 1990. As I reopen the boxes
after many years of neglect, I discover that much of my copy protected, games
are corrupted, oh my poor oids disk:-(sniff. Some disks I was able to
make backups of others I should have but didn't (disks are expensive:-)
so finding img copies has helped me back up my originals, today. I was so
happy to fix (replace) some disks that went bad. Ironically I rarely if ever
play these games, I just can't stand having software, in my closet that doesn't
work when I pull it out after 7 years of neglect.

I believe I had owned RVF racer for 3 years before I found the time to play
it. Dungeon Master, heck I booted it up often, saved a game, came back every
6months or so to play and forgot what I was doing:-). I am only now thinking
of downloading all those help files and maps from University of Michigan.
Take 6 months off from reality and finally start/finish this game;-).

If you are looking to back up your original, you may find some sympathy here
and maybe some other alternatives, such as buy a used copy etc. however if you
are just collecting old great games that you have never owned, well its a
neat nostalga trip, but you will not receive any help from here. Nor should
you.

Take care
trying to be better than a dog in heat:-).

ADDMEM increases the GEMDOS-buffer, the same way the oldy
FOLDER100.prg from Atari did ;-(
Gettting the message: "Zu wenig interner Speicher" (shortage of
memory) you have to put this program in the AUTO folder!
This according to the German MagiC manual. The German happen to be my
neighbours ;-)

Bye Bram

Take a look at those who write in this ng. Lots of shareware,- yes.
And a lot of commercial software as well. Depending on what you want.

Or take a look at System Solutions software list. Or Indogo2.
Both web adress cabn be found at my hp.

Yes, thats funny. I am, to this day, still abel to amace some people I
work with. Making a animation on a STFM 2.5 MB, transfere the animation to
a vidio tape, and show off.

It is even better when I use the Falcon to do this. Those hefty PC machines
can`t do that without some expencive add ons.

That's what they all say!

Check your MTU with that recommended by your ISP. I had major
problems a month ago because they added a new path with an MTU smaller
than the 1500 I was using. They suggested 1006, and that resolved the
problem. You have nothing to lose.

Ignore the HTML, Brian. It just contains the browser version of what was
in the original text-based post. Many people use Netscape's newsreader,
and have a parameter set that sends both copies. In reverse, those running
Netscape will have the HTML part formatted to their screen. Essentially
it's a waste of bandwidth.

>Also there part that says next part I didn't seem to get? Is there a next
>part?

No, there's no next part. The two hyphens at the end of the last boundary
means there are no more attachments:

Source record: 110970

On 28 Dec 1997, Brian Van Tilborg wrote:

>Internet providers can be pretty clueless, and considering I knew nothing

[snip]...

The problem I have has nothing to do with my provider (dsoe.com). The problem is connecting to a specific site in which I use their NT-based server space to host my pages (www.excelprinters.com/tos.htm). And I need FTP access to do that, which is what I had -- using NEWSie and AFTP -- a week ago (and for the past year). The FTP password is useless to me if the connection is outright refused. CAB 2.5 refuses a connection, too. If I use a PC, there are no FTP/HTTP problems whatsoever.

The domain excelprinters.com is really a virtual server hosted by an ISP by the name of Axion (www.axionet.com). It's _that_ ISP not giving me any concrete answers. I don't have an account with them -- just an invited guest to a domain they happen to host. The people at Excel Printers itself know very little about their account, and wouldn't be able to help me in the least (they're in the printing business, not the 'net).

What I'll probably end up doing is getting Web space and moving my pages to dsoe.com. Their servers are Unix-based.

What escapes me is why most other Atarians don't experience the problems I have with that NT-based server. If I can't find any answers, which looks to be the case, I'll just move the pages <g>.

Thierry Schembri wrote:
> Now, you can do the right choice !!!

Thanks for the informative article, but there is one more thing, I hope veryone will consider when making their choice. That is, that Darek Mihoka of Emulators, inc..(Gemulator) is a dishonest, unscrupulous person.

Its been two years since I bought a copy of Gemulator from Toad, and my problems have never been straightened out, and they never will be.

At the time, I was sent a copy of Gemulator without a registration card. I gave Toad ten kinds of hell, for doing this too me, but they finally assured me, by telling me that they called Darek directly and he 'registered' me...

Well, I never got the free upgrade that I was promised, and which I needed because of the problems I was having with version 4.5. Toad doesn't remember anything and isn't helpfull in any way, shape, or form. Darek, for his part, has never done anything except insist that I should purchase Gemulator directly from him in the future...he wants me to buy Gemulator a second time!!! He did say about five months ago, that if I proved to him that I had purchased Gemulator by sending in an original Gemulator disk, or copy of the manual cover, he would upgrade me to the most recent version.

Well that was many months ago, and I sent him everything, original disks manuals, everything. I don't need them, its been years and besides, I have a copy of the useless program on my hard drive and I have proof of purchase (I purchased it on my credit cards and VISA has the records)... Well, he still has not upgraded me. At first, I thought there might be some confusion between him and Toad. After all, Toad is not exactly my idea of an ideal retailer... but Darek said to me personally that he would upgrade me to the current version and HE IS A LIAR.

Get any other version, except Gemulator, its buggy anyway.

Are you a programmer ? Then I'd suggest to have a look into the programming
docs that come with STinG (STING.HYP). It's merely *one* STinG function to
call (set_sysvars()) to make the CPXs obsolete, if you do not use STinG for
LANetworking.

It will still be a few more releases before ConfSTinG will be in the package.
Just having to do too much other stuff.

Cheers Peter

Do you see the same using FracIRC ? I'm asking because if I use FracIRC
with STinG I'm just as fast on IRC as if I used some IRC client on my
Linux box ...

No server should refuse to serve clients that aren't capable of HTTP 1.1
except for policy reasons. Apart from that, few servers would actually see
that CAB.OVL isn't up to 1.1 yet, as apparently the latest CAB.OVLs imple-
ment almost all 1.1 extensions. Of course they can examine the id string,
but if they do it, it must be considered the policy of the operator :-/

Apart from all that, please note that CAB got little to do with HTTP.

No. Have a look into a postscript file with a text editor. You can edit
it that way (although it's painful). PDF is binary on the other hand.

> count correctly (sometimes 1600, then 20, then 0, then again 600)

If you ask me, don't use any ! Usually your web service provider provides
some other and better means to check how often your pages are accessed, and
web counters fool any caching systems that might be involved. Forget the nice
speed increases offered by proxy servers, and CAB will completely download
the pages again and again each time the user only wanted to check if the
contents changed (off course they changed, the web counter is a new picture).

I consider web counters the worst invention on the web just after the "Best
viewed with Netscape" shit.

I do. I'm probably not at all significant, but I like the idea of having
the choice.

> extended modes to shel_write() and MagiC supports one of them (if I remeber
> correctly),
> limit memory useage for a launched application.

MagiC has both IIRC.

> group of atari users so it should reflect the state pretty well.

maus.sys.atari.software is internationally accessible just as well, so the
same experiment could be carried out there too. So although I agree on the
choice of language, I can't help but calling your suggestion a silly one.

A *very* subtle difference, the author hooked to. Every sane person
would grab the intented meaning anyway.

An "OS replacement" does not need to be a full OS by itself, while a
"replacement OS" does. It's quite silly to distinguish ...

I really do not want to start an argument here, but the speed
increase is really not *similar*. In fact it is quite different
if you consider VDI and filesystem.

>...
>Other advantages I feel that Geneva has is that the number of

MagiC's limit might be fixed, but it is certainly big enough (>100).

>...
>Both Magic and Geneva will run on a 4Meg ST, although
>Geneva has lower memory and disk overheads.

Did you ever measure Geneva+SomeDesktop+MiNT and compared that with
MagiC+SomeDesktop?

>problems have disappeared, but the probs i have saying upper are still
>present sniff !!

I know a couple of guys who had one of the fixes made, but still experienced
problems (even though thing did get better than before the firts fix) - and
when they let me make one of the other fixes, all the problems disappeared.
So I would suggest that you try one of the other modifications after all.
Unfortunately, it seems like different Falcons need different modifications
to the CPU-clock - and some machines don't need a modification at all...

Good luck!

5064. Re: Can I Use CAB, MegaSTE and SLIRP on UNIX shell acct?

Newsgroup: comp.sys.atari.st
Date: 1997-12-28 00:00:00 UTC
From: Mille Babic <mille@tripnet.se>
Message-ID: <6846di$p0k$2@minox.tripnet.se>
Source record: 111016

```
Hi John!

John Norton skrev i meddelandet <679vvc$5o5$1@thoth.nilenet.com>...
:Has anyone used a web browser, MegaSTE and SLIRP (on a unix shell
:account)? My provider now has SLIRP available to use, but I am a little
:wary of trying it without a little advice. Any help appreciated!
:
```

When I use STiK to access the Internet, I use SLIRP. My provider doesn't support SLIP, but PPP and SLIRP. You have to ask your provider how a connection should be made, if they don't know what Atari is then tell them that a connection with STiK is nearly the same as Trumpet Winsock and MS Win 3.11. They have to tell you how a script should look like.

```
Alternative: Use CoNnect or similar and phone your provider manually with
your modem, write down everything that you actually see on the screen and
answer every input field, then <Return>
when you can see your providers command shell (line Interpreter) write slirp
and press <Return> and write down every single word and IP-address (it will
help you to edit DIAL.SCR in STiK)
```

Here's mine DIAL.SCR:

```
BAUD_RATE = 38400
HANGUP = ATH
PREFIX = ATDT
INIT = ATH1
CONNECT_WAIT = 35
REDIAL_DELAY = 20
PHONE_NUMBER = 7252525
SUCCESS = CONNECT
FAILURE = BUSY
FAILURE = NO CARRIER
FAILURE = NO DIALTONE
WAIT = 5
FIND = ogin:
RESP = your loginname here
WAIT = 5
FIND = assword:
RESP = your password here
WAIT = 5
FIND = start:~> The commandline at my provider, not yours
RESP = slirp
WAIT = 5
FIND = IP
RESP = 10.0.2.15
```

```
WAIT = 10
```

This is all the help I can give you with this, I m not a TCP/IP-guru. A friend of mine helped me with this one.
Maybe Peter Rottengatter can expalin what SLIRP actually does and is, I just can t.

```
Mille Babic
```

5065. Re: CAB 2.6, ICONN and FIFI

Hi Joergen!

:prunus@post3.tele.dk skrev i meddelandet
<684255cuj1@news1.inet.tele.dk>...
:Is there anyone in this ng, that has any experience with FIFI the new
:ftp program from Application System ?

:I can't get it to work properly. It will not let me save the preferences,
:it make a messy desktop, dialog and windows won't go away, and somtime
:it won't quit. I have to make a coldboot, just to get the system going
again.

:I using MagiC v.05.13

I can see in the header of your article that you actually use ASH Emailer
v1.0. You are the first I saw here (except Oliver Buchmann) using this app.

Yes I had some problems with Fiffi first time I used it, then after a while
it worked quite well. You have to start PPP-Connect first, then Fiffi. When
on-line (strange indeed) you can add and change settings, but don't save!!!
yet! Connect to ftp.funet.fi use anonymous and you e-mail address as
password and add '/' as the start catalog.
Wait for 8-15 sek and when you actually see Funet contents, then save
settings.

As I said, strange but it works.

BTW:
I need a snapshot of ASH Emailer with comp.sys.atari.st in one of its
windows for my website, you can't send me one, can't you? Original size 1:1,
IMG-file.

Mille Babic

If someone wants to take the time to get to grips with the docs in the
original www???.zip then it's perfectly possible. Gawd! I wrote it and
can't remember its name atm!

Anyway ...

I had no intention of spending the rest of my days recompiling it
each time a new module arrived so between me and Flinny we came up
with something more durable which *he* could maintain with only a text
editor when a new module or script arrived. Thus, there should be no
reason why it should not work now. Heck, it might even be possible to
have it install STiNG modules and scripts as STiNG has its own config
front end!

I've been waiting too long for it. I was lucky enough to purchase MagiC2 which *did* have english programming info at the end of the manual. Not a lot but enough to get me hooked on programming it (and thus help others do so).

The lack of english programming docs since has stopped me buying MagicPC. It was touch and go considering the price anyway but it was the docs that clinched it. :-(

The two most common reasons for programs dying under MagiC and not
under singletos is memory leaks and duff pointers, arguably the same
thing in most cases. Singletos may not be using the corrupted areas
(or may have executed the code/data before corruption) whereas MagiC
will have another process using it.

It usually can. What it cannot protect against is when when the rogue
program runs amok and scribbles all over the others, or MagiC itself,
for which hardware protection is needed.

There's not a vast amount that needs so be known to program an
"average" MagiC application fortunately. Most folks who have
programmed multitasking systems can be of help with the pitfalls.

>If he needs help with translating into english I bet that there are
>a few willing to help.

If I knew technical german and I was offered a free copy of MagicPC
(or a few MagiC updates) then I'd do it on the basis, that I did a
bit each week, perhaps posted in comp.sys.atari.st.programmer, which
someone could compile together. Once done, maintenance would only
require the new parts be posted with a request for translation.

Surely they can manage this???

I'm not getting any sleep!

The reason is - the video recorder! It's one of those VideoPlus jobbies. What triggered it off was when I entered a duff code and it accepted it, which got me to thinking (instead of counting sheep). How the heck do they work? The most common TV programs have the shortest numeric codes. Ok. Fine, some sort of frequency coding. What is really bugging me is this: are the codes fixed or is the system adaptive to changes? Like, for instance, if they moved Eastenders (spit) to 2am would it still have a short code?

[Well, I did say it was off topic] <G>

What's the best way to turn a Music Studio 88 file into a PC midi file?
What I've been doing;
1 running midi cable from ST to PC
2. Set PC recording software to make measure equal short note in piece
(and eighth note would equal a time signature of 1/8)

This has work for some piece but not others. Also each track from Music
Studio must be done supportly.

Message-ID: <883291558.870272@moon.aa.net>
Source record: 111033

Can anyone tell me where Addmem prg needs to be? I was informed by a dialog while visiting Titans site that there was insufficient memory and I should use Addmem Prg. Odd that, as I had about 10megs free at the time. I've had a few odd experiences lately with MagiC 5.11. The manual (I guess you could call it that) makes no mention of the prg,but I'd guess it goes in either the Start folder or the Auto. Shortly after this problem I closed Cab 2.5 and started Newsie which also complained of as shortage of memory. Any clues? Thanks for your time.

Nope, one is an OS, and one is just some replacement doing almost the
same things as an OS.

Get Midi Music Maker (MMM226.LZH or ZIP) for the ST. It will batch convert
folders full of Music Studio files to midi files. BOOM! your done!

Happy Festivus,
Dave

Could anybody volunteer specifics as to what programs won't work with Geneva or MagiC? I have Geneva 6 and am experiencing some quirky kind of problems with Papyrus. For example, doing a spellcheck causes a crash. Cut and paste give a funny warning message. These may be due to accessories or badly behaved AUTO programs - I haven't checked it out thoroughly.

Also, as I understand it some of the earlier Falcons give MagiC problems. Is there a way to tell which Falcons? Can you look at something on the motherboard?

>than the 1500 I was using. They suggested 1006, and that resolved the
>problem. You have nothing to lose.

I don't know what my provider recommends, but my uncompressed SLIP's MTU setting has always been 576, so it's small to begin with. I tried a few other values this afternoon, based on your advice, but it didn't make any difference with that NT-based server. 576 may not be the right value but I've left it at that because it's worked so well. And, indeed, my STiK connections are fast and reliable.

BTW, I can't get a connection to your Web site either. CAB resolves and then times outs waiting for data. In NEWSie's 'Open URL', I can't get your default document (newsie.html). A dialogue appears saying 'Retrieving URL' and it stays at 0 bytes. I can, however, log onto ftp.primenet.com.

If other people using the same software can log onto our sites, then it must be a problem with the default.cfg (i.e. my ISP). But what, and why would 99% of the other sites come in fine for me? Mysteries abound...

Hi Dennis,

This is from a STiK/STiNG perspective - others can give you requirements for MiNT - or even using Lynx.

1. Most likely, you'll first need HSMODEM7 - even though you only have a 14400 modem, I've found it to be a necessity.
2. You'll need a TCP/IP layer - choices are STiK, which is SLIP only, and STiNG, which supports SLIP/CSLIP/PPP. Finally, you will need a browser - I would recommend CAB (the Crystal Atari Browser) version 1.5, or 2.0 Demo, as more people are familiar with it than they are with the demos of the WENSuite or Adamas browser, and therefore more likely to be able to answer any questions you might have. And finally, you'll want to make sure you have a recent version of the CAB.OVL - I use v1.2704. You didn't state whether you currently have web access on another computer - if you do, a good source (one of many - in addition to the author's sites themselves) of the requisite software is at Mille Babic's site:

http://www5.tripnet/se/~mille

Since you're using NEWSie, I know you have ftp access, so you can try:

ftp://193.190.205.13 Directory: /archive/atari

Once you have a working setup, you might want to try this link for details on optimizing it:

http://www.geocities.com/Hollywood/Academy/2034 - It's John Dooley's 'STiNG HELP!' site.

Hope this helps a little.

Terry

No, I'm definitely using METAXBS. However, I've been having other
SCSI problems lately, so now I'm not so sure Spin! has been a problem
(though ExtenDOS Pro doesn't have the same symptoms). I need to take
care of these other problems before I investigate Spin! further.

From: claytone@aa.net
Message-ID: <883385480.694502@slave1.aa.net>
Source record: 110907

The clock in my Falcon runs slow, but only when the Falcon is turned OFF. As long as it's ON, it seems to be fine. Anybody have any idea what's going on here? When I had Nemesis installed, I also had Alex (at ATY) install a new clock module, but the problem still exists! Correct me if I'm wrong, but I seem to recall that the Falcon's clock, battery, and (clock-speed crystal?) are all in one module. So it would seem it is NOT the module. What else could it be?... auto programs?... accessories?.....???

Thanx for any help-

Lite version? There are only the full version and the demo version, no
other versions.

> Could You explain me how to format partitions and manage the Iomega zip

If you have the full version of HDDRIVER have a look at the manual. If
you have the demo version you can't format or partition your ZIP because
the demo version doesn't support this.

5107. DOS-XFS error

Newsgroup: comp.sys.atari.st
Date: 1997-12-29 00:00:00 UTC
From: mike@bbsgate.interware.REMOVE.TO.REPLY.it
Message-ID: <711_mike@bbsgate.interware.REMOVE.TO.REPLY.it>
Source record: 110911

I have in problem in the Atari NOS development. I get a DOS_XFS error in MagiC 5.03 that locks the system.

- the error seems to appear while trying to fclose a file that was also fopened and fclosed in a (parallel) subroutine.

- I could only test the error in MagiC 5.03 on an Atari TT030

- there is no error on plain TOS and MagiCPC (MagiC 05.02)

- I tryed cbhd and hddriver, various AUTO combinations

- no documentation about that DOS-XFS error

- NOS actually compiled with Lattice C

What could be responsible for this error ?

HD Driver version 7 works with the SCSI Zip drive. Don't know about HDD
6, as I upgraded from HDD 3! Ask Systems Software about the cost of an
upgrade.

In a previous article, tchermok@flash.net (Edward Williams) says:

>Whats the best bang for your buck for a falcon SIMM board
>any help would be great
>thanks Ed
>
>
I installed an updrade board made by Computer
Direct in Edmonton. It was also reasonably priced plus it
could take edo or non-edo ram. My falcon works just great
now that I have 14 megs of ram. I'm sorry but I don't know their
new phone number or web address. Hope this helps a bit.

> the whole system just hangs. The only way out is to reboot. Any ideas
> as to what I should check?

Here is additional info:

I am using MagiC v 5.03 on a TT with 4 meg ST and 4 meg TT ram hooked to
an external USRobotics Sporter 28.8 Modem via Modem 2 port.

When I use the terminal mode on Iconnect to login in manually to the
system, I get the standard login screens for user ID and password, then
I get the following:

PPP session from (198.109.38.10) to 198.109.38.12 beginning....~}#!}!}!}
}4} and every few seconds more "strings of garbage characters" fill the
screen until it finally hangs up.

Has anyone know why this is happening?

Thank again,
Neron

Is it possible to use either of these scanner on a Falcon?

Logitech color or HP Scanner
They are the small type that use a roller to feed the pages.
I saw them at Office Depot for $99.!
Is there any PD or Share W. driver software on the net for these?
Is there any commercial soft w. available?
Is there anyone using this type of scanner with a Falcon?

Thanks a lot, Raymond

Vandeweghe Jo <dipching@ping.be> wrote:

> The only problem is the printing resolution ... it's a very low one or
> better said :"a very very bad dithering coming from the CAB/NVDI
> combination" ...

Using NVDI 4, you should always use the TrueColor or greyscale
(halftone) printing driver (this can be set in the NVDI driver
CPX). Even for black and white printers like the Atari laser you
should use the greyscale/halftone setting. Then you'll get the best
results.

If you use monochrome printer drivers CAB will dither the images
for monochrome output. But NVDI will scale the image to the higher
printer resolution. Scaling images that are already dithered will
lead to bad results.

Okay, don't use the "load fonts" option if you have a lot of fonts and/or don't care about changing your window fonts. I have 500+ TrueType fonts and it takes nearly 3 minutes to load at boot time or when I change resolution.

I have had a couple of messages saying the ST+ Fanzine web page was unreadable because of the dark background, unfortunatly no setup info or return emails?.. When I test it.. the background doesnt show.. and as its a table over a background then I can't see whats doing this..

Anyway for the few that had problems, I removed the dark onyx type atari background and replaced with a light grey atari background..

Anyone who had problems at the ST+Fanzine webpage should now retry..Please ??? and let me know if thats fixed it.. If it hasn't then I will remove background pictures... Just let me know.. its that simple :)))

Mike,

I have CAB 2.5 working with STing. Install Sting according to the directions that come with the STing.LZH archive from the STing web page. Also download MODULES.LZH and place the "serial.stx" file from the modules archive into the modules folder in place of the older one from the sting archive. Make sure you also get the latest copy of CAB.OVL for use with Stik/Sting. Do not use the CAB.OVL that comes with CAB 2.5. That works with PPP connect. Put the Stik/Sting CAB.OVL in the CAB modules folder. That should do it, although you will have to work out a script to get the Sting Dialer to connect to your ISP.

5139. Word Perfect & Hard Drive Problems

Newsgroup: comp.sys.atari.st
Date: 1997-12-30 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <689kl4$7n8$1@newsbell.bellglobal.com>
Source record: 110797

I am a longtime WP user, and thus had suffered through the numerous updates
and bugfixes. The last version which I managed to find was version 4.1 of
August 1989. I did see a version that came out around 1992 that support
big screen resolutions and TT's. If you can help me locate this update, I
would appreciate it.

The following crept up around two months ago...
Also I am having a problem with WP and I don't know if it is a problem with
my HD 204 (highly likely:-) or something in WP that I have overlooked
(possibly not). This is a problem that has just crept up so I will explain.
Non WP users may not know what I am talking about, but Hard drive people
may know about how virtual directories are created with WP.

WP writes a file called {BVT} and {TVT} to drive C:, this is set up in
the startup procedure. Currently WP no longer is writing these files to
my C partition of my SH204. In fact the last time that it did write these
files, when I rebooted, they disapeared forever. When these files disapear
another thing happens. The F5 file selector using either WP own or My Universal
file selector, fails to show ANY FILES and only FOLDERS. Now if I Select
F3 to retrieve files only, all files and folders appear normal, and this
is how I have been operating. My setup hasn't changed for WP in 12 years
so I don't know why this is happening now. This occurs with a clean, system
as well. WP is installed properly, (you'll have to trust me:-). Virtual
drive C and WP is on partition D. And drive C still has 250K free to write
to if needed for the virtual file.

Finally only to confuse the issue more. I just hooked up my 1040STe to
my 520ST using midi net. When accessing WP on the SH204 connected to the
520STs dma port, I discovered that Hitting F5 shows ALL the files on all
partitions and not just the folders. This is what just reperked my interest.
Why can the 1040ST see the files, accessing the drive through the midinet
yet the 520ST can't, when accessing directly?

Well I am living with things as they are, and would like to add that one
time my HD crash around Dec03, I reinstalled all my software that I had backed
up, after reformatting my hd. WP worked properly once, creating the {BVT}
files, only to once again have them disapear upon a reboot and go back to
the current problem.

Well thats enough.

5141. NT/Atari Server Problem Solved

Newsgroup: comp.sys.atari.st
Date: 1997-12-30 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <689t6m$2fj@thoth.portal.ca>
Source record: 110799

My connection problem to my own Web pages is now gone! CAB, NEWSie and AFTP are finally working after being 'locked' out for well over a week.

It ends up my provider (dsoe.com) didn't switch to Sprint for their backbone. (Charles, you owe me one Yankee dollar, which is a day's wages up here in Canada <g>.) I didn't change _one_ thing as for STiK and its clients (or anything else software-related).

I think what worked were the two unanswered e-mails to the ISP hosting this virtual domain. What they changed, I don't know. Why most providers connected fine at the time, I don't know. What I do know (thanks to Charles) is that IPs within a certain range wouldn't connect. That, of course, is inexplicably fixed.

5142. Help! Tragedy! I need an Atari SupraBoot Program

Newsgroup: comp.sys.atari.st
Date: 1997-12-30 00:00:00 UTC
From: nine2pleez@aol.com
Message-ID: <19971230044301.XAA27290@ladder02.news.aol.com>
Source record: 110800

Hi. I am a struggling musician who had a major accident. I've got a 20MB SupraDrive HD (old but worked great) until I got a directory crosslink. Used a recovery program but the program lost many music files. Many of these files are for a studio project due the first of the year. If anyone has a copy of the "SupraBoot Program/utilities please let me know. Willing to pay. (With in reason of course!) Please help an aspiring musician keep a roof over his head. e-mail me at A92GTA@aol.com

Thanks

ArchieM :)

Dennis, this may be a stupid question, but why did you connect it to the
DMA port? The TT has a very useable SCSI port :).

Most Maxtors are shipped with a factory default (SCSI) setting of 6.
There are jumpers on the bottom of the board to set the ID numbers. I
have e-mailed you the text file for the 130 meg units.

Regards,

Steve Hammond

Dennis,

What is the Maxtor model number? or you can go to Maxtor's web page
www.maxtor.com and get the spec sheet for that drive, it will have info on
SCSI ID settings.

>
>

Sure, could be the speed. I never tried anything else in the Gizmo. On
my A/B Falcon I installed a 55Mhz clock in the optional socket. I
can't run the A/B much over 40Mhz, but I use the A/B HI switch running
at 55Mhz for a better video rate when using Videlity. The switch runs
the CPU at 1/2 speed. Not so noticable under Apex Media. Wish Apex was
compatible with my NOVA:).

Didn't you get the last Expose (non working) card from Toad? Someone
had purchased one that didn't work and was going to have it looked at
by an electronic type. I sure wish I could get my hands on one. My
ScreenEye just dosen't cut the mustard.....:(.

Yes, it will. Any SCSI drive works, regardless of its type. The
characteristics of these drives are described in the SCSI-2
specification and any drive that works according to this specification
will also work with HDDRIVER. It's as easy as that :-).

5152. MAGIC 5.13 - HD floppy - Problem !

Newsgroup: comp.sys.atari.st
Date: 1997-12-30 00:00:00 UTC
From: acounis@lpnsu7.in2p3.fr
Message-ID: <68aoof$218$1@ccpnws.in2p3.fr>
Source record: 110810
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello World,

I am having problems using HD floppies under MAGIC 5.13 / MAGXDESK. Formatting takes a looong time (more than 10 minutes when the floppy is not rejected) and often does not end very well : it complains about sectors/tracks not valid. Under TOS 2.06, no problemo.

Reading/writing to a HD floopy crashes most of the time : sector/track not valid. Again, TOS 2.06 doesn't complain.

Formatting/Writing/Reading with a DD floppy does not cause any problem.

I am using a MegaST12 (yes 12 Megs!) with a home-made HD module (Ajax controller). As I said before, I don't have any problem under TOS (either with DD or HD floppies)

The problem is the same with preemptive or cooperative multitasking.

Anyone has the same problem than I have ? Especially people with a MegaSTe or TT ?

If so, email me (with a detailed setup of your machine/software)

My machine: MegaST4 with Aixit Magnum ST, MAGIC 5.13, Magxdesk, CBHD5.02, PAK3 68020, home-made HD module with a real Ajax.

Thank you.

I'm afraid that I don't know the answer to that question! (g)

>commands? Regarding Alexander Clauss' program: I heard that there were some
>problems, but that seems to be fixed with the latest release of CDPlayer.

The latest seems to be the version that I already have, 1.4A, it will still
not play audio CDs. The busy lamp on the CDROM flashes but there is no
response to commands sent from the program.

>>I'm referring to Q-Time movie files, using Guillaume's Mplayer prog, and
>>some movie clips from the Homa Systems House Space Missions CD played via
>>its "front end" program.
>
>Hmm. If these are regular files -- can you copy them to hard disk and play
>them back from there?

Yes, no problem. AVI, WAV and MOV files all play as they're supposed to when
copied to hard drive, but that only proves that Spin is correctly
transferring data?

I suppose that it's possible that Extendos is better able to cope with this
CDROM (an NEC) than Spin??

Here's my config BTW:

```
*BOS, c:\spin034\spin_sd.bos, A:10
*DOS, c:\spin034\iso9660f.dos, Z:A
;CDROM is ID2 (8+2 mapped to icon Z)
```

Lexmark inkjets you mean. Most Lexmark lasers are not "Windows Only" and should work with an ST. Be careful when buying any printer for an ST. Some companies have a line of standard printers, then they stick in one or two "Windows Only" machines. The new HP 11x17 printer is for Windows only. Some of the Epsons might be too. Make sure that the printer mentions Epson or PCL3 compatability. Laser's should have PCL4 or 5 compatability. Any mention of "Windows Optimized" or similar wording should be a warning sign.

5160. JTS A.K.A. Atari takes a sucker punch to the gut

JTS Reports Third Quarter Loss, Drops
3-Inch Portable Drives

By Joseph F. Kovar
San Jose, Calif.
9:45 p.m. EST Mon., Dec. 22, 1997
....

JTS Corporation today reported net loss of $60.6 million
or $0.39 per share on
revenues of $24.0 million for the fiscal third quarter
ended November 2, 1997.

This compares to a net loss of $58.4 million, or 49 per
fully diluted share, on net
revenues of $28.4 million for the second fiscal quarter
ended August 3, 1997.

The results include a one time charge of $38.0 million
associated with the San
Jose, Calif. based company's decision to exit the 3-inch
portable hard drive
business.

Joseph Prezioso, executive vice president of the firms
Finance Administration
and company CFO, called the $38.0 million a one-time
restructuring charge
associated with suspending support for 3-inch portable
drives.

According to Prezioso, JTS decided to give up on the
3-inch portable drive
form factor because "market acceptance was not what we
would have
expected." He noted the company's limited financial
resources were unable to
support the product line.

JTS is not the first to exit the 3-inch portable drive
market. Western Digital
Corp., located in Irvine, Calif., announced on December 2
that it would exit this
market.

Recent efforts to restructure JTS have lead to reducing the break-even from
750,000 units per quarter to about 350,000 units per quarter, according to
company officials. Employment at the firm has fallen from a high of 8,400
worldwide to the current 5,800 persons.

JTS was founded three years ago on support of the 3-inch portable hard disk
drive product line, Prezioso said. The firm has manufacturing facilities in India.

According to Prezioso, the Asian economic turmoil has actually helped JTS.
"The rupee has devalued by 10 percent, which helps our costs," he said. He
noted the firm purchases components in US dollars, and so has not suffered
from the problems faced by manufacturers that relay on local currencies for
imports.

Prezioso said JTS is currently working on two new projects. It hopes to
introduce drives with 2.1 GBytes per platter using MG (metal and gap) heads
by the end of January. "We hope to get one more generation out of this
technology because of its low cost," he said.

By summer, the firm also hopes to introduce 2.1 GBytes per platter drives using
MR heads. It will feature four platters per drive instead of the normal three,
Prezioso said.

```

AFAIK, PPPconnect needs pr&#65533;emtive multitasking to run.
Check your MAGIC.INF file for a line that starts with #_TSL
This line must not be commented out (;#_TSL...) and the first value
must be larger than 0. With the wrong setting here, Magic will run in
cooperative mode.

```
A sensible setting is: #_TSL 2 32

I've got a 548meg scsi drive (seagate) inside the TT, this drive came
off the ST the airlines trashed on my trip and I needed to access the
files on that drive. So I used the TT's DMA port. Any port in a Storm!

> no jumpers like the seagate has.

I don't think this is a device number problem. I am not sure of
the exact cause of your problem, but the symptom is quite
familiar: I experience it when I leave my Atari SLM printer
turned off on the ACSI bus. Stupid question: do you have an SLM
printer? If so, turn it on or unplug it from the ACSI port. :-)
It seems the ACSI port needs a signal from the device(s) that is
plugged into it, or else bad things happen, including the loss
of access to the floppy. In your case, it would seem that that
signal is missing even though the device is turned on. What
host adaptor are you using? Could you borrow another one and
try again? Also, you might try swapping the hard drives, that
is putting the seagate in the external case and the Maxtor in
the internal drive bay.

WRT drive IDs, your internal Seagate is on the SCSI bus,
entirely separate from the ACSI bus. There is no need to change
the Maxtor's ID number if it is working already; the two drives
are not in conflict.

I hope this helps.

>Just to tell everybody, I got the latest upgrade of FIFI, and now the hole
>package works perfect.
Fiffi v1.03? Yes, this version works quite well. You will find the swe RSC
of this version at my website tomorrow.

>Running MagiC 05.13, Iconn and CAB 2.6, FIFI and Emailer on a Falcon.
>14 Mb ram and a small harddisk.
Well, my system is nearly yours, then...
MagiC 5.1, IConnect (PPP-Connect) 1.1, CAB 2.6, Fiffi v1.03, but not EMailer
yet on a Falcon 40MHz,
12 MB RAM and two SCSI HD 540MB+1.0GB and a CD-ROM (I need a driver for
MagiC).

BTW.
NEWSie covers nearly all these functions, FTP, E-Mail and News. What NEWSie
really needs now when the functions is optimized is a little face-lift, the
new windowbuttons should have icons too.

>And a Happy New Year to all of you atarians.
Yes, 1997 was really a good year for us atarians.

Source record: 110828

Well I opened the case and took everything out of the supra case, the drive
is a maxtor 7120SR note the R, its 3.5 inch x 1 inch and the jumpers
are not like the pinout, they are something like this...

XXXXXXXXXXXX ribon cable

J601 J602

JJ JJ
OO OO
JJ OO
OO OO
OO

O= Open J= Jumped

I moved the 602 jumper up one and the bootup locked up at the maxtor
put it back and it does ok, but no floppy online then.

I used to always get this on my Falcon under MagiC5. The solution I found
was to turn Background DMA *OFF* in the Magic Conf CPX. That fixed it.
I've never found the Background DMA option to be very stable.
Check that your's is turned off.

>The problem is the same with preemptive or cooperative multitasking.

Like I say. It's probably linked to background DMA.

```
Not quite. In fact, most veteran MagiC users would tell you to
comment that line out and use the CPX to turn it on. That eliminates
problems with AUTO programs that don't like running (or at least
installing) in preemptive multitasking mode.

I don't know if this will work, but judgeing at your original posting
you could do this:

1) Load in a Mono emulator (Sebra is a good one, free with every (now
gone) ST Format Cover Disk)

2) Use the 'sizer' and make sure the bottom doesn't go futher than half-
way accross the screen

3) You can now quit your mono emulator, and it _should_ work perfectly!

I know I shouldn't read it, but heres a solution:

1) Load it into SDUU
2) Uncompress ZIP, LZH, etc.
3) Run!

This is really not very possible, if I look to the NVDI cpx options
when assigned to the ATARILS.SYS which must be used by the atari laser
printer, the halftone greyscale option doesn't exist ... unavailable !
.. this option seems only available when using color printers !!!

Man, that is too bad that it won't work with Nova's...guess its too tied
into the Falcons original hardware (it does support 640 x 480/TC under
Nemesis though, right?)

>Didn't you get the last Expose (non working) card from Toad? Someone

Don't know if it was the -last- one or not, but Phantom and I did get
2 of the last ones. We live pretty close to each other and have tried a
few things. We swapped out power supplies/RGB splitters to see if we
could wind up with a working one, but still no go. His -almost- works,
at least he can see a few things that are recognizable as video/pics. I
get nothing but a blank screen on my Falcon. Alex at ATY Computers has
said that (with no guarantees, of course) that he will look at mine and
see if he can do anything with it. I'll probably do that shortly. I'll
post any success's here... ;)

>area that has done these mods. Thanks,
>
>Sam

Sam, I've got my Falcon in a Desktopper as well, and I simply removed the top half and sent it to Alex at ATY Computers, and he installed Nemesis for me and did a very good job. If you like, I'm sure he would accept the whole unit, but of course, it will cost more for shipping that way. You'll love Nemesis! ;)

PS If you are going to be doing any Math calcs, and RGB stuff, then make sure you have the FPU/RGB mods done at the same time. (unless you are sure you're going with the AB040, then you don't need the FPU)

Well. It depends on what BOS driver you use. If it is SPIN_SD.BOS, then
probably something doesn't work too well between the installed SCSI
driver and the drive. Get me more details :-).

On the unit that gets some video, try inserting a small piece of
cardboard (match book cover) between the large electronic componet in
the splitter (I think it was pink) and the piece that rest nearly
apon it. That will improve the signal from the splitter. You may have
to play around with the thickness of the cardboard. This is direct
from David at Titan (about two years ago). It vastly improved the
color output of the splitter for me. If you get a black and white
picture, this should cure it.
Also, check the power regulator
inside the splitter. I forget the exact voltage, but Toad was modifing
the splitters and whats his name did a pretty shitty solder job
causing power loss. The splitter is very sensitive to the DC input
voltage and current. If you have one with a nice solder job (if
modified at all) you have my old one:). The docs with the unit tell
what the values should be, and must be strictly regulated.
If you have intermittant video, you might try seperating the ground
between the splitter and the RGB cable into the Expose unit. Install
an adjustable resistor (pot) inline between the grounds. Experiment with
settings while your displaying real time video. You should be able to
get a good solid picture. When you power down, you will have to go
through the adjustment procedure again. There is an oscillation on the

Expose board that needs a little more than a hacker to look at:). (me not Alex:).
You will have problems capturing from a VCR unless you have a dual standard with both NTSC output values available. I had good luck with my JVC camcorder. If you have the Bird of Prey CD Rom, you can look at a direct RGB capture from the Jag into the Expose bypassing the splitter. The directory is Toad/newstuff/expo_jag.zip. This was done with a cable I made up and using the above mentioned modification.

Let me know if the "Phantom" wants to sell his partially working one. I would pay a heap for it:). I also have some nice Falcon toys for trade.

Mike

You mean the actual logo? Here's a tip for you then:

1) Put "That's Snap!" as an accesory
2) Load in Hyperpaint and go to the Info box
3) Use "That's Snap!" to grab the logo.

If you havn't got either of the programs, let me know and i'll email you
a GIF picture of it.

Ok, I have STing set-up on my 520ST with the modem. I have a 1040STe connected to it via midi cables. I would like to have them communicating to one another via STing. Anyone already doing this, could I see your Route.tab. I think I understand how to do this. I am also under the impression that I must run HSmodem, midi prg? Do I just randomly name the host computer? I also want to use the remote dialing, which is the masquerading part I believe. As you can see I have a weak grasp of this, however with your help, and another couple reads of the docs, I should be fine. I have read them, and could implement what I understand, however I am always timid before I try something new.

Also I am using Med Net. Must I disable this program? I would like to use both. I don't want to lose access to the ST hd. So far I have had Med net hooked up and used STing on the 520ST at the same time, however after a few minutes STing will crash. Although I have not set up the midi settings in STing, I do have the MIDI STX loaded on bootup even though I don't currently need it, could this cause the conflict?

Can I get both Computers on the internet at the same time, with the one modem? This is what I want to do. Greedy aren't I. I thought I had briefly seen a post with this regard earlier in the month.

So, bottom line is two computers sharing one HD, and two computers networked together for all that general networking stuff, and finally any of the two computers to be able to access a single modem, from anywhere in the localnet whether at the same time or not. Lastly is there a limitation with STing as to howmany computers I can network through midi connections. Most other programs limit it to 2. If this answer is in the documents forgive me:-).

PS. Please describe to me exactly what masquerading is.
Thanks.

I hope I don't sound to ignorant in this post, I am always learning;-).

Adhi 3.01:-).

Ok, I am not going to solve my STe dma problem, it is a hardware fix. I was
just going to live with it. This is why I was going to use midi net on the
STe so that I could access the HD with the STe through the midi connection.
I follow your story on your MegaSTe hd problem.

To the other author who wrote that med net is a dirty piece of software,
you are correct, however, it is what I have to use, unless another alternative is
found.

Thanks to all whom answered. I have used Med Net for about a week, and it
is doing what I intended it to do. I can now access the HD with my STe.
Speed is somewhat, comprimised, but it is better than no HD for the STe.
Yes there are some problems, and it doesn't like certain ACCS and AUTOs.

Now I haven't got it to like STing yet, I would like to be able to use
STing in concert with Med Net.

I am going to separate this post for a STing specific post.
Thanks Brian.

Hi all:
First off,let me wish all Atarians across the globe, a very happy,and
healthy New year!!

Having owned Apex Media for a long time now, I haven't heard much about
Apex 3. Are the Black Scorpion group still working on this project??
I have to admit i haven't used Apex Media much recently, but I still LOVE
this program. Any Apex Media animations floating around????
I probably have uploaded all of mine to DELPHI.

Thank you.
Barry Summer (still proud owner of 14 meg Falcon)

Have you posted that message into all the pc newsgroups?
That might be a good place. I mean to run gemulator I guess you need a
pc, or maybe the goal of this game is to convert the atarians into pc
user, numbing them, saying that even if they get a pc, they will still
run atari?

happy new year

>behaved AUTO programs - I haven't checked it out thoroughly.

What version of Papyrus? I use version 4.xx and it works no problem.
The cut & paste thing, I get two messages from the latest versions
of ST-Guide & QED (Dan told me it was a new system call). With Everest
there are no error messages. Besides the two messages everything does
cut & paste correctly.

I never used MagC but the authors should be commended for their work. I though
will not be leaving Geneva just yet. I got Geneva just just before the AV
server thing became a standard. Its just Geneva/NeoDesk Stalker/Steno
integrated very well together and work on my Stacy & Falcon.

Okay, I moved AVSERVER.APP to my START folder, but QED still gives three bombs when loading.

I tried AVSERVER=AVSERVER (in case it was just looking for the name of the program), but that doesn't work at all (neither the document nor QED is loaded from SMU).

I also tried AVSERVER=C:\GEMSYS\MAGIC\START\AVSERVER.APP, and that's when I get three bombs when loading QED.

Any other suggestions?

Agreed about the danger from high voltages, but I think you'll find that the fault mentioned is not corrected by trimpots but by moving some of the small permanent magnet strips round the neck of the tube. My guess is that one or more will have slipped during transport. If 'hplace' isn't able to do it himself, try a TV service shop - even if they don't know Ataris, the procedure is similar for most monitors. Note that they'll need the Atari there to get a raster on screen though.

Happy New Year to all

Hi Thorsten!

As I posted elsewhere - the SM 124 scan geometry is adjusted with small strip magnets round the tube neck rather than potis. But I endorse your warning about the high voltages, though I don't think there are any near the magnets. In any case, play safe: Keep one hand in your pocket! And wear rubber-soled shoes.

[snipped]

It's available for the monochrome Hewlett Packard Deskjet 500 printer,
however, it didn't really seem to make a lot of difference for the
actual images. It *did* do a good job of indicating changing font
colors, and background/border colors in tables - but it really slowed
down the overall printing job. In addition, I got some unexpected
effects. For example, the "UMTUDY award" thingie that I have on my
welcome page printed in inverse on a black background - not
what I would have expected from the display colors.

Hi Mille

Yes, I love Newsie to, but I lost my Slip connection a few month ago. Now we only have PPP, so this PPP Connect with everything is just what I needed.
For almost 2 month I had to borrow a pc laptop just to maintain my homepage, and I do not fancy anything with MicroSoft in it.

This Emailer and news reader I use now needs a lot of improvement, but for a start it is good.

FIFI the ftp program also need something to be done, even it works well.
I don`t know it it is FIFI or something else, but the transfere speed is sooooo slow, I only got a cps around 600. That is not satisfying.

cheers Joergen

Source record: 110864

Thanks for posting, Peter! I have told that you might just have the answers! The CAB-1.5 docs talk about using Minix partitions, but I have been told that I only need to do this if I download a web page and the associated files for later viewing. But, for just surfing the web CAB converts the longfilenames to the TOS 8.3 scheme so I don't need to worry about longfilenames.

I am using the CAB-1.5/CAB.OVL/STik combination in an attempt to use slirp emulating slip. I have so far been unsuccessful. Everything works as planned, even to the point that when I type in a URL (within CAB) it does get sent directly to slirp. It is just that CAB then hangs with two bombs and a message at the top that says something about "119". I know that it is working up to this point because if I quit CAB and run Storm I see the web page scrolling down in my capture buffer.

Any help is greatly appreciated. I really want to get my MegaSTE surfing even it is will be in mono or with graphics turned off for awhile.

It isn't just STiNG that has problems without HSModem, STiK won't work without it either. Someone (not sure who) mentioned that the HSModem code was going to be included in Magic but hadn't been. Not sure if that's true or not, but with Magic the installation message changes from 'Installed' to 'No extra Gemdos. Installed.' This looks as though Magic still requires HSModem there to correct the serial port code in Magic, even though I'd have thought that it would have been corrected.

Another reason why I may need it is that I'm using a hardware upgrade for 38400 bps instead of 19200.

Actually if you go to www.emulators.com you can pick up Gemulator cards with more current TOS versions for a lot cheaper, dont go by TOADS over inflated prices, they mean nothing.

Let JTS Die!!!!

It'll make it easier for a company like Williams or Activision to buy Atari and finally do something useful with Atari instead of just chopping it up like a dead animal and selling it off.

Curt

Hi everyone,
At last I've had the time to add a page about CAF-compatible HD's to my site.
Please continue sending me reports about working/non working harddisks, so I can update the list continuosly. Thanks to everyone who's contributed so far :)
Also check out the rest of my site - it contains a lot of useful information for Falcon owners and Cubase Audio users.

Best regards,
Claes

I think you have it backwards. Some of the earlier versions of MagiC
had problems on the Falcon. MagiC 5 is very stable on the Falcon,
though.

What they should have done was keep Atari Interactive going, it was a good idea, Atari selling updated versions of it video games on Playstation, Saturn and on the PC's. It obviously worked since everyone did it. Then Atari could have gotten into producing new game titles. If profits were good enough, they could have started publishing the Jag titles Telegames are selling. Atari could've gotten into selling joysticks for other platforms, basically anything that had anything to do with games for any system Atari should have gotten involved with and diversified itself. Perhaps they could have developed 3D graphics cards for PC's and started selling those as well, with refinements and enhancements, they could have improve the Tom& Jerry chipset and taken to new levels and then sold PC Game kits with A graphics controller, Atari Joystick and a CD-ROM with Atari 2600 emulation and games as an intro pak.

This may sound a little far fetched, but not really, its a down to earth idea which could have happened. Its obvious Atari can't get back into the console market, the PC market is dominated by the Wintel monopoly (even Big Red: Apple is hanging on for dear life) but Atari could have sumed up its talents as a game company and game name and sold the very same items that Microsoft itself is selling such as joysticks and Return to the Arcade and such, Atari could have cashed in on this and with extra profits, it could have done minimal support for the Jaguar system.

I recently installed a Maxtor (a 225 meg unit) in my homemade hard
drive tower case; you'll find the SCSI device number jumper pins on the bottom
of the drive itself, it's in a group of three or four pins.

BTW, I got the Maxtor from a great US company called HiTech for
$29.95 US & $11 shipping- they specialize in discontinued and
refurbished hard drives. You can check them out in Computer Shopper or
at www.hitech.com .

Are you using a TT and running Papyrus 4 in Fast Ram? I found this
quite unstable. Using TT Ram is better.

Actually, although I continue to use it, P4 is a bit unstable, period,
in my experience. These problems were not present in P3 nor in the
demo of P5. I don't believe these problems are the fault of Geneva or
Magic. I look forward to the english availability of P5.

I would say strange chars are the output of either syslogd or chat or pppd
on the console. To avoid thesescreen screwings, try a utility like
console(.ttp) which will redirect the console output in a nice window (if
you use toswin or similar). Anyway, you should normally not get strange
chars.

> The counter starts but no modem reaction. After 34 sec. I get this:
> "The connection was lost! Do you want to reconnect"

You must not drag the chat-file put the .ppprc (or equivalent) file! ;-)
It's perfectly working here. My $HOME/.ppprc is like this:

```
lock
connect "/usr/etc/chat -v -f $HOME/.chat-script-hol"
modem
crtscts
passive
defaultroute
/dev/ttyb
38400
```

And my .chat-script-hol is:

```
ABORT 'NO DIALTONE'
ABORT 'NO CARRIER'
ABORT BUSY
ABORT WAIT
ABORT DELAYED
ABORT FORBIDDEN
ABORT denied
ABORT 'Probleme reseau'
"" ATZ OK ATDT0153266500 CONNECT "" gin: dorian word: secretpass
```

> And this is what I get on the syslog file
>
> Dec 26 22:45:56 ping1030 pppd[26]: pppd 2.1.2 started by root, uid 0

> Dec 26 22:50:14 ping1030 pppd[28]: /dev//usr/etc/pppd <150>Dec 26 22:50:14 pppd[28]: Exit.

Did you remap your modem port (Serial2 on the Hades?) to ttyb or something?
Does your serial port works fine with other proggies under mint?

Just to compare, a normal connect log should looks like:

Dec 14 12:05:20 salomon pppd[110]: pppd 2.2.0 started by root, uid 0
Dec 14 12:05:56 salomon pppd[110]: Connect: ppp0 <--> /dev/ttyb
Dec 14 12:06:00 salomon pppd[110]: local IP address 195.154.33.16
Dec 14 12:06:00 salomon pppd[110]: remote IP address 194.149.172.5
Dec 14 12:22:50 salomon pppd[110]: Connection terminated.

The 'LCP: timeout...' part is not a problem though.

I really suspect a pppd setup problem (maybe related to a mint.cnf or naes.cnf? problem). This is a bit stupid, but did your pppd setup works fine (when launching manually with sh for example)?

> BTW: I'm doing this on a Hades 060 running freeMiNT 1.14.6/MiNTnet/N.AES/Thing 1.20

This is definitely the ideal sys to run mint ;-)
Hope this helped a bit. Bye Martin.
